Stephanie,

The ear doctor was puzzled so I called you!

Got it! Thanks.

Jeff

Here's a story on the X-38, NASA's version of a NSRV (those copycats!).

http://www.space.com/missionlaunches/x38_test_011214.html

Yeah, but they only tested the CRV from 45,000 feet. We may still
have a chance at a parafoil altitude record! By the way, I like their
color scheme.

Yes, I liked it too. Can we get a parafoil like that?

Paul

1605. New challenger to the BS2p?

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-15 01:03:18 UTC
From: Mark Conner
Topic: 1605 Message: 1605

http://www.basicmicro.com/products/stamps/index.html

At first glance, this seems promising:

8K program space in one bank
300 bytes of RAM
33K instructions/sec
32-bit and floating-point math
40mA power consumption
Interrupts
Uses superset of BS2 commands
Upgradeable firmware
Hardware A/D, PWM
$59

This may be what I kind of expected out of the BX24, but didn't quite get.
I'm going to download the manual and check it out more fully.

Speed of sound free falls could make me kind of queasy.
And i thought our balloon descents were rough ;)
Pretty cool, just glad i dont have to buy the material for the p-sail
either.

1608. (Fwd) No video/audio on the tape

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-15 20:15:09 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1608 Message: 1608

Jeff, I got this message from Mark. I'll need a new copy to send
out. Can you make a total of three more?

Paul

Got the tape today, but no video/audio. It's been recorded, because my VCR
is detecting the sync pulses for the timer. I think the recording part of
the copying setup was set to the wrong channel. It was labeled and the
record tab was punched out, so whoever made the copies *thought* they had
recorded it.

I picked up some foam rubber for capsules, so please bring your parts. I'll bring some styrofoam for others building a capsule. I don't have enough mylar, can someone bring a space blanket.

Jeff, we'll need your sewing machine. We should bring some tapes to show. I'll bring a VCR/TV.

Have have lesson two written for the Stamp.

Be there, aloha.

Mine was fine Jeff.
Suppose they got erased accidently at one of the post office hubs by
x-ray machines or something more exotic ? Hmm.. research for the X-File
team.

Finally got time to watch it Friday. Best video i have watched yet.
Great job on the camera mounting. It had just the right view of the
horizon and land for me. I was impressed with how stable the capsule was
most of the time. Even the wife was impressed.

One thought, it would be nice to have a live altimeter reading shown on
the screen during flights.

I have such a board. It will place on screen any text you send it. It can
be used in an upcoming flight if you want.

1618. Nice GPSL2001 layout in January 2002 Up Front

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-17 17:11:57 UTC
From: Hank Riley
Topic: 1618 Message: 1618

QST has run two photos by Shari Tews, KC0KZK which were
submitted to QST by Mark Conner, N9XTN. One is of the
three balloons at the moment of liftoff and the other
is Mark and Leonard Vasey, KC0DOQ, with their payloads.

It's on page 21, the last of three Up Front pages.

The captions are pretty complete, but I would have
liked at least a mention of the giant Nov/Dec 2001
Weatherwise article.

I'm going to request that QST consider a mention
of that article in an upcoming QST Media Hits
(January MH is on page 16).

Hank

From: Rick Widmer
Topic: 1558 Message: 1622

Sorry it took so long to get back on this...

I am very interested in working on this project...

It may be years before I find time to do it alone, but I'm willing to help with a group effort. I live in Kimberly, so I may not make many meetings in the Treasure Valley, but we have the Internet.

I have a bit of PIC experiance, and a friend with a PIC programmer who has been using them for years. I'm willing to work on the programming side of the project. The first step is to decide exactly what we want the thing to do...

Mark Conner wrote:

TinyTrak has some possibilities, but if we are going to build something for balloon flight I think we should shoot a little higher.

mgray wrote:

This device is much closer to what I had in mind. Mgray have you looked at the TAPR's PIC-E encoder? Your project looks very similar.

http://www.tapr.org/tapr/html/Fpice.html

I think the PIC-E is a perfect starting point. I would like to take parts of PIC-E and parts of mgray's beacon. One big advantage of the PIC-E is the library of existing code, and the fact that it was designed for expansion. Mgray has an excelent power supply I would like to steal.

I've named the device "communications controller." It sits between 1 or 2 GPS receivers, the on-board radio and the flight control computer. It worries only about ommunications, leaving control of experiments and telemetry data gathering to the flight controller.

We need 1-2 serial inputs that watch the GPS data stream, and an audio input/output with PTT to the radio and a two way serial connection to the flight controller. Both the PIC-E and mgray's devices already provide the hardware layout for most of this. The rest is software. What I have in mind goes something like this:

One or two GPS receivers are set to send position and altidude information to the communications computer as frequently as possible. The GPS data is buffered in PIC memory.

The flight controller should compose telemetry strings, and pass them to the comm controller at any rate it can. The comm controller is responsible for buffering the tm data and sending it on schedule. There should be a way for the flight controller to mark a message as priority, meaning it is sent out as quickly as possible. The comm controller should limit priority messages to make sure it does not hog the APRS channel.

If possible telemetry data should follow the MIM standard for telemetry transmissions. APRS can display column headings and scaling of reported data in this format. The flight controller should be able to transfer the data needed to scale and identify the tm data on request. The comm controller will buffer the data and send it on schedule. If the MIM standard can not be followed, we need to use a different packet identifier for our tm data. It should be possible to send both kinds of tm data during a flight.

It might be wise to go ahead and put 5 analog and 8 digital inputs on the comm controller and let it do the MIM compatible telemetry encoding, and provide for non-standard packets from the flight controller. I'd rather minimize the connections between the connections between the comm controller and the rest of the capsule, OTOH putting the MIM inputs on the comm controller vastly simplifies programming the flight controller. It also makes it harder for the flight controller to respond to telemetry data. I'm not sure what is best.

The comm controller listens for APRS messages addressed to it. Here are some of the messages it should respond to:

TM - send latest telemetry string from flight controller/
TML - send telemetry interpretation data
GPS - send latest position report from any GPS
GPS1 - send latest position report from GPS1
GPS2 - send latest position report from GPS2

LAUNCH - switch transmission timing to launch values

FC: - send any data after the ":" to the flight controller.

On power up the comm controller sends an APRS message to local receivers telling them that it just woke up. It then watches the GPS and flight controller inputs, and sends the first complete message from each. Once it has sent a message from each source it sends a status message every

few minutes showing which inputs are sending valid data. Less frequently it sends a position and altitude report and telemetry data. All pre-launch transmissions are local.

When the comm controller receives a LAUNCH command the first thing it does is send a WIDE aprs position report followed by a WIDE message "LAUNCH: hh:mm:ss" showing the time of launch. If desired it can also send a LAUNCH command to the flight controller. It then waits a few seconds then sends WIDE the telemetry interpretation data followed by a telemetry report.

During ascent the comm controller monitors the GPS data and compares the position data with the previous report. If the difference is larger than expected it sends a new local position report. Every 1-10 minutes it should send a local telemetry report followed by a position report and altitude. (This leaves the altitude visible on APRS.) If it is getting data from both GPS inputs it should alternate between them when it sends positions. An APRS message "DELAY 03" would set the delay between local transmissions to 3 minutes.

Most transmissions are local so the people receiving data directly have rapid updates. Every 1-9 transmissions is sent WIDE. The number of local transmissions for each WIDE transmission can be set with the APRS message "WIDE n". WIDE 1 means every other transmission is WIDE, WIDE 9 says to send 9 local transmissions for each WIDE one. The first packet after a WIDE command will be sent wide. Every 2-9 WIDE transmissions should include the telemetry interpretation data. This value will probably be preset when we program the PIC, and can not be changed from the ground.

If the most recent altitude is less than the prior altitude it sends a WIDE APRS message "BURST hh:mm:ss" with the time of the highest altitude recorded followed by the highest position report recorded from either GPS. It then falls back to the same transmission timing as ascent, or maybe we have a different schedule for descent. Sending a "BURST" APRS message can trigger this action too. The position reported after a burst command is the latest one recieved from either GPS.

If you send an APRS message like "PANIC 5500". The comm controller will start sending local position reports every 30 seconds once the balloon descends below 5500 feet. The ratio of WIDE to local packets will stay the same. Sending a "PANIC" command will trigger rapid position reporting instantly. This should probably be set before launch based on the predicted landing site, but can be changed during flight.

Sending a "BEACON" command, several GPS reports with the same altitude, or the loss of both GPS data streams triggers a one minute transmission of the balloon's callsign at 5WPM. The transmission is a CW modulated tone on the standard FM carrier. If GPS data is still available this transmission is followed by an APRS position report and telemetry data. If it is possible to change the transmission frequency for the beacon it should be done. Once the comm controller is in beacon mode it will send

one minute of CW during minute 0, 15, 30 and 45 of each hour till the battery runs down, a LAUNCH or BURST command is received, or the power is shut off. This allows for DF fox hunting techniques as a last resort.

There are two other senses I would like to work into the system. One is a microphone that listens for burst and impact. During ascent a loud noise will trigger a BURST command, and during descent it will trigger a BEACON command. This will provide for much more accurate event reports from the capsule.

The other is some way to sense the exact instant the balloon is launched. This could be a plug you pull out of the capsule just before release, or maybe a plug that is tied to the ground that is pulled out of the capsule when it is released.

One final interesting feature would be a way to set some altitude breakpoints so the comm controller will send a command to the flight controller when the capsule passes thru a specified altitude. If you want to open an experiment at 10,000 feet you set the comm contrller to watch for that altitude, and send the event to the flight controller. It may also send a report via local or WIDE APRS when a certain altitude is passed.

What do you think...

Rick

p.s. It looks like it may be a very long time before the amateur radio test will be given in the Magic Valley again, so can someone please let me know what the TV test schedule looks like.

I might suggest the need for cut-down commands from the ground.

The LAUNCH command might also use a cut-down device to cut the lines
holding the balloon before launch. This would also be an active test of a
good deal of the electronics. If it does not release, then scrub the launch.

On flights where there is a float condition (we had on like this) the balloon goes up and down at the upper edge of the flight. A decent rate greater than some fixed amount, say 500 ft/m, would solve this problem. A storage of the highest altitude and then reported with the burst info would also help.

Sound is very low at altitude and might be confused with other sounds (wind noise, string pops).

>The other is some way to sense the exact instant the balloon is
>launched. This could be a plug you pull out of the capsule just before
>release, or maybe a plug that is tied to the ground that is pulled out

Also, as mentioned above, the cut-down device could cut the tether lines on a DTMF or APRS command to launch and record that as the launch time.

1624. ATV Quarterly

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-20 17:29:35 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1624 Message: 1624

I submitted my conference paper to ATVQ. Mr. Harlan would like more articles in ATVQ about ballooning. I'd like TVNSP to write a series of articles for publication. This is your opportunity to be published.

I've given an outline, we need to flesh it out in later articles. ATVQ is published quarterly and I'd like TVNSP to have an article in every issue.

We need short articles in the following topics.
Balloon trackers
Filling
Checklists
Prediction
etc

Can I get people to commit to articles? I was thinking Jeff could write one on setting up creating a balloon tracker with a KPC3, DJ-S11, and Etrex. John the Younger could do one on checklists and overall procedures, and John the Elder could write on balloon handling.

Please, everyone, pick a topic and let me know what it is. Let's get our name and recommendations out there.

Oh, be sure to include pics with your article. Share any ideas you have.

I'll be going on vacation Saturday. I'll be back one week later.

Paul-

I have been 'listenening in' on the sig about the great video TVNSP taped on their last flight. I was wondering if it would be possible to get a copy of the tape. I will be at my sister's in Meridian from Saturday the 22nd to the 26th, and would be available Sun or Mon to meet with someone. I have enjoyed reading about your flights.

Let me know of any cost or if you need a blank tape in exchange.

Thanks

Cool, it is idea time. The better the initial design the easier it is to make it work.

> I might suggest the need for cut-down commands from the ground.

So the question is, does the comm controller handle the cut-down command itself, or pass it to the flight controller. See my reply to Mark about what my ideas are on the division of labor between the processors.

My initial idea would be that this should be a command passed to the flight controller for action, but an argument could be made that this is a critical function that the comm controller should be able to initiate even if the flight controller crashes.

> The LAUNCH command might also use a cut-down device to cut the lines

Same comments as above. Also do we want to fly the weight of two cut-down devices, and use the power at the start of the flight? I don't like the idea too much, but this is discussion time, so what does everyone think?

I think if you have two way communications with the payload there are a number of good ways to check things out before launch. For example you can put the system thru its paces and make sure all the commands you will be sending them and making sure things happen properly. You could even unplug the cut-down device and replace it with a LED to make sure that command is acted on properly.

This is one reason I would like some way besides watching the GPS to detect burst. How long does it take to accelerate this fast? How much up and down did you see? Even if an audio burst detector works most of the time, watching the GPS data would be a good backup.

> Sound is very low at altitude and might be confused with other sounds
> (wind noise, string pops).

I've only watched (heard) one flight video, but in that tape the burst was noticibly the loudest event on the tape. I did not get to hear the landing as the tape ended first. I hope to get another video tape to play with and I'll know more after I watch (and listen) to it. Does anyone have any other ideas besides sound to detect burst?

> Also, as mentioned above, the cut-down device could cut the tether
> lines on a DTMF or APRS command to launch and record that as the
> launch time.

I definitly thing the device should be listening for APRS packets addressed to it. After all the hardware we need to receive comes free with the hardware we need to transmit, so it is just a matter of receiving APRS packets and looking for the balloon's callsign.

> Check out the VOI web site at http://www.voiceofidaho.org/ and pick

Thanks! Maybe I'll be able to take the test next month.

Interesting, I came to the opposite conclusion for about the same
reason. I expect the PIC program to be tested to death and never
change, where the BS2 program is customized for each flight. I see more
risk with the BS2 programming than the PIC, so I'd rather cover the most
critical functions there. That way if you crash the mission program in
the BS2 you still get your position reports.

> If we include data reception, the comm processor could hand that back
> to the BS2 to determine what to do with it (cutdown, change beacon
> rate, etc.). Having an interrupt capability on the CC/PS (requiring
> replacement of the BS2 with something like the BasicMicro ATOM) would
> help with ensuring commands aren't missed.

I think we would be crazy not to use the receive channel for commands.
You probably want the controller listening so it doesn't step on other
transmissions (a function of the MX614 modem chip) so you need to feed
audio to the modem. Once you have that connection made you have serial
data from all APRS packets on one of the modem pins. The PIC-E code on
the TAPR web site should handle decoding packets, so that is pretty much
already written.

The PIC is already doing interrupt processing on the incoming serial
data streams so we could just make it responsible for buffering
commands, and let the flight controller ask for commands when ever it is
ready to accept them.

My biggest worry was how much processor it will take to monitor 4 serial
inputs. I found a thread on the PICLIST that looks like someone is
planning on making a 4 serial input MIDI application that runs at
31,250bps, with a 20MHz PIC clock rate, so our 1,200bps data streams

should be no problem.

http://www.infosite.com/~jkeyzer/piclist/1999/Oct/0789.html

One thing to consider is the PIC-E already manages to read serial data from the radio/modem and one GPS, and promises leftover processor cycles to "decode the incoming serial data and construct outgoing packets, but to do significant amount of processing of the data as well." They are doing it with a 10MHx processor, and 20Mhz is available.

If we use a synchronous serial interface like SPI between the communications controller and the mission controller we can simplify that connection. Does the BS2 have support for SPI? (I've never worked with one.)

Another way to offload serial communications would be the Maxim MAX3100 SPI UART:

http://dbserv.maxim-ic.com/quick_view2.cfm?qv_pk=1731

I think this is probably overkill, but if we can't get enough instructions/second out of a pic monitoring the serial inputs directly, we can add a couple of these to monitor the GPS inputs and offload a lot of work. The 3100 will buffer up to 16 bytes and interrupt the PIC when data becomes available.

Rick

I like the comm controller doing it. The flight controller should do it also.

The cut-downs are very light weight. I would also suggest a solar panel to handle some of the power requirements during the flight. This can also be very light and will produce very good power during flight. 5 volts at 4 amps should be possible.

I have included an attachment that has an excel file with the last altitude
info that happened during our float. Note. the info does suggest that there
is no missing data. We lost battery at the end, due to the long float time.

The MIM and Tiny Trak (as I recall) are really mos, rather than modems. We used a timer sucessfully on the last mission to cut the balloon away. We'll continue doing that, but give the CC/PS the ability to terminate the flight, along with a DTMF decoder.

Selecting a MIM over a Tiny Trak or Tiny Trak over a MIM shouldn't matter except for code used to send telemetry. I'll do some more research and design a CC/PS for the Tiny Trak for those who want to go that way. As Mark said, I may be taking advantage of a "bug" in the MIM rather a than a feature in my current design. I like the idea that we can write code for the Tiny Trak, it's not just a black box that puts me at a disadvantage, becuase I don't know what's happening or even if the MIM will be available in the future.

Is this PIC the one on the Tiny Trak?

My preference is to have the TNC send what ever data it recieves
from the BS2p.

>

So this TNC does decode packets? I didn't know that. The BS2p
has a pseudo interrupt. Rather than use that, I'd rather give the
world a time slice to sends commands to the capsule. Perhaps
I'm just not an interupt-driven kind of guy.

> You probably want the controller listening so it doesn't step on other

The MIM has a hold-off feature that does this. Packets are so
small that I'm not too concerned with this. However, I will purchase
a ramdrive for the CC/PS for storing flight data. however, this is
primarily for making my job easier of analyzing data. I really don't
need to know where all the chase vehicles were located during the
mission (which is some of the chatter I get in the current logs).

Okay, so this is the PIC-E, not the Tiny Trak. More research.

All Basic Stamps do SPI. The BS2 series has native commands
built in, rather than kludging it as the BS-1 does. I use SPI on the
CC/PS for the ADCs (MAX186). The BS2p also does One-wire,
which I have given some thought to use for a iButton EEPROM (the
black box, data recorder).

By the way, I watched Lord of the Rings last night. They took a
few liberties with the book and dropped parts.

That's my feeling also. Redunancy is the word, even when I'm poor
at meeting that goal.

The new launch controller will use ground based batteries and
controls. I use to test capsules at the launch site by downloading
a test program, however, now that I'm forced to launch everywhere
but inside a building with power, I've dropped this. This is one
positive thing to say about Kansas.

> The cut-downs are very light weight. I would also suggest a solar panel to

When you get your copy of the video, you'll see what little effect
the cutdown has on the rest of the descent. It's that #$%!@##^%$
balloon hanging off 30 feet of load line that really messes up the
descent. I'm thinking that we may get away with a shorted load
line now that we have a tested cutdown device.

As for the solar cell idea...
Where we're going, its always a sunshiny day. They should work
well. I just want to make sure they're lighter than batteries.

From: John Knapp
Topic: 1626 Message: 1638

As the Holidays draw nearer and nearer, I would like to take a moment to wish everyone a safe, happy Christmas and New Years.

This past year has been fun and both Deb and I are looking forward to working with the group in launching and chasing the balloons again next year. While I am not actively building a capsule or any electronics this winter, I will be working on understanding APRS and some other 'basic' stuff so next year will be more fun for us.

Again, wishing everyone a Merry Christmas and Happy New Years.

From: Rick Widmer
Topic: 1640 Message: 1640

>
> Is this PIC the one on the Tiny Trak?

No. I am looking at stealing some of the hardware design from PIC-E,
and mgray's devices and building something from scratch. My profession
is programmer, so my interest is in making a custom program that does
the exact job needed, rather than using something close and already
available.

> My preference is to have the TNC send what ever data it recieves
> from the BS2p.

There is no TNC here. The TNC function is inside the PIC, but once you
leave existing programs behind you can do what ever you want. Consider
that if you look at the TinyTrac, PIC-E, MIM, MIC-E, and even the custom
tracker mgray designed, the one thing they all have in common is a PIC
chip. TinyTrac and PIC-E source code is available for use or study.

> So this TNC does decode packets? I didn't know that. The BS2p
> has a pseudo interrupt. Rather than use that, I'd rather give the

> I'm just not an interupt-driven kind of guy.

BASIC isn't an interupt friendly language. I can do anything we want
within the limits of RAM, ROM and I/O pins. Looking at the PIC family,
that isn't all that limiting. RAM is probably the worst limit for this
application. There is alot of data that needs to be buffered to make
sure valid data is always available for transmission. I am thinking
about using the PIC16F77, because of the number of I/O pins and amount
of memory. Digi-Key has them for $8.40 each, quanity 1. The chip is
available in DIP package for prototyping or PLCC(L), and TQFP(PT) which
allow for a much smaller and lighter surface mount board.

> The MIM has a hold-off feature that does this. Packets are so
> small that I'm not too concerned with this. However, I will purchase

> need to know where all the chase vehicles were located during the
> mission (which is some of the chatter I get in the current logs).

Before the next flight I should have a program that will eat logfiles
and spit out a sinble copy of what the capsule sent. It is a pretty
trivial program, I just need to write it.

> All Basic Stamps do SPI. The BS2 series has native commands
> built in, rather than kludging it as the BS-1 does. I use SPI on the
> CC/PS for the ADCs (MAX186). The BS2p also does One-wire,

> which I have given some thought to use for a iButton EEPROM (the
> black box, data recorder).

Cool, I will probably make the flight controller interface a SPI Slave, with the flight controller the master. Every message to the flight controller will be buffered (up to the PIC RAM limit) and passed to the flight controller on request. At any time you can read a byte from the comm controller. If there is a message in the queue you will get a character. When a complete message is passed you will get a 0 value. All messages will be ascii characters as defined in the APRS spec. If you get two 0s in a row threre are no more messages.

The flight controller can send status reports to the comm controller as often as it wants, the comm controller will buffer them, and send the most recent complete message when it is time to send a status report.

BTW, I've been researching the APRS specs, and I missused the term "MESSAGE" earlier. Event reports like LAUNCH, BURST and anything else sent from the balloon will be in a bulletin. Bulletins go to everyone listening in on APRS. Messages are addressed to an individual, and must be acknowleged or rejected or they will be retransmitted ad nauseum. Commands sent to the ballon will be APRS messages, and and ACK or REJ message will be sent back to the sender depending in if the comm controller understands the message.

I have developed a PIC based ARPS transmitter/motherboard for ballooning. Unfortunately my website is currently down, but if you're interested, I can post some details on here.

Basically, it's a PIC16F876-based controller with an MX614 modem and a bunch of I/O ports. It's closely based off of the PIC-E but I've re-worked the code to fit ballooning. The code that I plan on sending up in ?February? has the ability to watch the altitude coming from the GPS and take pictures/turn on ATV at appropriate levels. Everything is written in CCS's C-compiler.

The board that I sent Paul is the same design, but that was the first revision. I'm currently on the third and have two successful flights on the basic APRS software routines.

1642. APRS logfile analysis program

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-22 18:22:11 UTC
From: Rick Widmer
Topic: 1642 Message: 1642

I've finally got something worth looking at on the APRS logfile analysis program. You can see the results for flight TV01F at:

http://www.mvas.net/balloon/tv01f.php

I wonder what happend around 42,000 ft on the way down? (7:07:02) The capsule appears to have lost half its descent rate, and doubled its horizontal velocity, in one minute. Is this the jet stream maybe? I see a similar glitch in speed (horizontal) during ascent, but it is not as drastic. It should be very interesting when I have the data reduction part tested and I try to graph the data.

Anyway... Now I need more test data! If anyone has APRS $ raw data of GGA and RMC packets for any flights, please email it to me directly. I will create similar web pages for all the different flights I receive. As masochistic as it may sound, I prefer very raw data, including all the vehicle positions and everything. If you have more than one log of a flight, I would like them all. This program is supposed to be able to filter out all other stations, and eliminate duplicate entries. I may as well give it a workout!

Please either send me plain text files, or copy and paste the data into a message. I don't have an easy way to use .doc or .xls files. Sorry. Unless there are Bulletins with the flight number, and title in the logs, please let me know what you would like to see st the page heading. Also, please let me know the callsign of the balloon.

When I am happy with the program, I will make the source code available for anyone with PHP available on thier server to use, and a server that will allow you to upload raw logs to be processed so you can grab the resulting HTML and add it to a site without PHP.

Comments and suggestions are welcome.

Rick

> Unfortunately my website is currently down, but if you're interested, I
> can post some details on here.

Yes, I'm very interested!!!

Have you tried, or considered receiving APRS messages as commands to the system?

Are you using the A/D inputs and such to generate T packets? If so do you do anything with Names, Units/Labels and Coefficients?

Are you running the camera and other experiments directly off the PIC, or do you have another processor on the flight?

How are you sending position packets? /,@ or $

When you get your site back up, please let me know!

Zack,

Could you us what your latest PC board dimensions are?

I'm also getting interested in a design that could be
configured particularly for balloon use, but would also
be suited for terrestial use.

I favor designs that employ a separate modem rather than
a PIC software modem.

I've been using PIC assembler and compiler developed
telemetry devices on our SkyQuest balloons for several
years. I'm not too sure how relevant the design philosophy
of these SkyQuest controllers would be to TVNSP, but Paul
has asked for an introductory discussion of the controllers
on the list, so I guess I'll put a short email together on
the subject.

3x4 (or 4.5... whatever Jameco's photo-resist boards are). It has a SMT connector on the back side that plugs into a daughterboard. The daughterboard contains and circuitry that is specific to a particular launch (baro, servo drivers, etc). The two boards then bolt together. That way, you don't have to start totally from scratch each time you change your payload - you just build another daughterboard and recompile the firmware. It even has in-circuit programming so you don't have to remove the chip - just unplug everything and hook the programmer in.

The motherboard has a temp sensor and primary battery indicator, along with a couple of A/D about ten digital I/O including the RS-232 UART capable pins. Received audio and GPS data are pass along to the daughterboard for DTMF decoding or a secondary processor.

The above picture shows the motherboard (no daughter in this pic), mounted to a Plexiglas chassis with a Garmin GPS-35 and a VX-1R.

I'm also in the process of developing a SMT version that would use the 16F877 for more A/D.

Zack,

Could you us what your latest PC board dimensions are?

I'm also getting interested in a design that could be
configured particularly for balloon use, but would also
be suited for terrestial use.

I favor designs that employ a separate modem rather than
a PIC software modem.

I've been using PIC assembler and compiler developed
telemetry devices on our SkyQuest balloons for several
years. I'm not too sure how relevant the design philosophy

If anyone has looked at this already, you might want to look again.
I've added some graphs, and now I'm trying to work out a way to show the balloon's track on a map. Stay tuned...

Hi Rick,

Neat program - I take it this makes the HTML and graphics automatically from a log file? Not familiar with PHP's capabilities.

Note that between 07:07 and 07:09 in this log that the xDOP went up and the # of satellites went down. My guess is that the fix quality for the altitude went down quite a bit too and the altitude numbers here aren't that reliable. Perhaps the payload was swinging quite violently and was not seeing enough satellites consistently. Or perhaps power problems were causing the GPS to have difficulty.

What I have in mind is you can upload 1-10 different APRS logs from a flight and a program combines them subtracting out duplicate entries. (This should take care of times when one of station is not receiving data and another is.) Then I will spit out a combined log that you can load back into APRS to re-play the event, with all stations, and another log that is just the balloon. Both of these files can be placed on a web site for future reference.

Then a second program (the one you are seeing) takes the balloon's log and does the analysis. Right now it is sending the results of the analysis when it is run, but it will be more efficient to write the output to a file, and make that a static web page. If I can get some logs with "T" telemetry packets and PARM, UNIT, EQNS and BITS messages I will make it show telemetry data too.

To everyone: If you have some raw APRS logs of balloon flights, please send them to me. I especialy would like logs from more than one station of the same flight so I can test the first program.

I have now added three maps of the flight profile. One is from above looking down, one is looking north from well south of the flight area, and the other is looking west from well east of the flight area. It is not quite as cool as the SPSS 3-D graph Raplh posted, but PHP can do the whole job in one script.

Cool! It may take a little while to get thru this file, as it is the
first full raw log I've seen, but once it is done, it should be pretty
easy to do the next one. I may even have a web site where you can
upload logs directly for analysis.

1652. KD4STH - bug in tracker?

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-26 13:35:41 UTC
From: Rick Widmer
Topic: 1652 Message: 1652

Looking thru the TV01G log Jeff sent me I noticed a couple of things.

1. KD4STH-11 never had an echo from a digipeater.

2. Your packets all look like:

KD4STH-11>APRS,WIDE,3-3:
^

KD7INN's packets, along with all the other wide packets look like:

KD7INN-11>GPSP0,WIDE3-3:

I don't see anywhere in the APRS protocol reference that shows any punctuation between the WIDE and the distance values. I suspect that may be why your packets never get sent on thru the digipeaters.

Rick

Rick

Your observation is correct. The comma is short for the "via" between alias paths. ie, CALL,WIDEn or CALL via WIDEn or CALL,WIDEn-n where the first n indicates the number of hops. The second n is countdown indicator showing how many hops the station took to get to a destination. You dont miss a thing,glad to see you are analyzing our data. I like the spreadsheet!!

BTW, did you get my raw data file i sent you 2or3 weeks ago? I believe it was TV01 H ?
Hope everyone had a nice Christmas.

We had a significantly harder time hearing KD4STH than KD7INN. Paul thinks
he didn't have the tones dialed in right. (Moot point on that particular
MIM module now. 8^( )

Correct, the 3-3 would not have counted in this case. However, the local
digipeaters should have answered to "wide" so that isn't the only explanation.

Bill

I've had more time to look at the data, and there is definitly something
more wrong. you can look thru the data at:

http://piemur.developersdesk.com/balloon/flights/tvnsp/TV01G/aprs/

The raw directory contains an entire APRS log for the flight.

The cleaned directory contains the same data, with blank lines, local
commands and digipeater echoes removed.

The combined directory contains a separate file for each callsign that
appears in the APRS logs.

I have a file of raw packets from KD4STH in

http://piemur.developersdesk.com/balloon/flights/tvnsp/TV01G/aprs/jkl

Notice that many of the packets don't have valid GPS MNEA message
identifiers. The vast majority have one or two characters from the ID
string missing. I don't think there are a dozen properly formed packets
in the file. The data after the NMEA identifiers looks resonable as far
as I can tell, but I don't think I'm going to worry about further
analysis of this tracker's output.

Rick

Hmmm, I'll take a look also, but should mention that the tail end of the NMEA string will be missing too. Paul has a 65 character buffer that he can stuff the NMEA string into and it's typically longer than 65 characters. The main part of the data should be there but if any software is expecting to find the checksum it won't be there.

I think this might be a good argument for the communications controller... Seems like it could deal with the GPS data and just pass needed data to the flight controller in a more compact form.

Ok - just looked at the data. I don't want to try tonight (too tired to be comparing bits accurately!) but my gut feel is the corruption you see may be single bit errors. I'd have to look at the binary representation of the ASCII characters but I think you may be seeing bit errors in the prefix.

One explanation would be the tones being "off". However, I think that's unlikely since the $GP prefix is always correct and so is the $GPGLL which Paul generates.

The other likely explanation would be that the flight controller is making errors as it reads the GPS data. My understanding is that it looks for the $GP to know when to start copying into that 65 byte buffer. If the timing is off a little it would be really easy to muck up the first byte or two. A quick glance shows no places where the character following the $GP is corrupted, but if Paul is using that character to determine what to do he probably would bypass one that wasn't recognized. This could explain why we got so few positions for STH.

I guess the good news here is that we can check this on the ground!

Bill

[big snip of theories of APRS transmission error mechanisms]

> I guess the good news here is that we can check this on
> the ground!

Let's run the GPS/STAMP/MIM combo soon, in the off season
and on the ground, to nail down this problem definitively.

With more than one party expressing an interest in a
packet assembling controller, it's likely that a better,
cleaner solution will be available eventually ... the only
question is when.

I'm moving ahead on getting circuit boards fabricated that
will me modified Mike Gray layouts. There may be two
distinct PCB options.

The rest of the mods for special purposes can be handled in
software and by leaving out PCB components not needed.
This design will have application on and off balloons.

Hank

1658. TV01H log

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-27 22:33:26 UTC
From: Mark Conner
Topic: 1658 Message: 1658

Can someone e-mail me (or post to the files area) a TNC log file from TV01H? I'm interested in all packets heard, from the chase team posits as well as the balloon beacons. Thanks!

BTW, I have the video and audio tapes Paul sent me. The video was very interesting to watch - I was on pins and needles at the end knowing what was coming. I also liked seeing the cloud formations in this video as well. I have the repeater audio converted to CD and will be making video clips in the next couple of days.

How was the time determined when the cutdown device let go of the balloon? Also, how soon after landing did the chase team members arrive at the site? I couldn't hear the conversations on the ground well enough to tell (and the beeping covered it up some anyway).

APRS+ format or text? I need to mail mine in anyway.

>How was the time determined when the cutdown device let go of the balloon?

It was a simple timer. Paul set it prior to the flight. I'm not sure what
method he used to determine when to set it.

>Also, how soon after landing did the chase team members arrive at the site?

Mere moments afterwards. We had it in visual till it went over a building.

Text format. I want to see all the packets, not just the ones parsed into posits and telemetry.

> >How was the time determined when the cutdown device let go of the balloon?
>
> It was a simple timer. Paul set it prior to the flight. I'm not sure what

The description that came with the tape has an exact hour/min/sec when the cutdown happened. I couldn't really tell from the video that that was the exact moment it happened.

Mark,

We knew the timer was set to go of at that time but not to the excact
second. That number is just a reference to find it on the video tape.

1663. Backup beacon construction finished

Yahoo group: tvnsp (2000 — 2002)
Date: 2001-12-29 06:36:33 UTC
From: Mark Conner
Topic: 1663 Message: 1663

I now have a working APRS backup beacon for future NSTAR flights.

Contents:
Yaesu VX-1R
Tiny Trak II
Motorola Oncore M12 GPS receiver
Synergy Systems SMK-4 GPS antenna
Custom board for power regulation, RS-232 level shifting and TTL logic inverting

Power requirements:
100-120 mA at 5.3V or higher (regulated to 5V for the TT2 and 3V for the GPS and antenna)
Yaesu VX-1R is powered by internal battery

Power consumption:
GPS: 75mA
Antenna: 5mA
TinyTrak2: 15mA
Other components: 15mA (estimated from total)

Weight:
4oz (Yaesu VX-1R)
8oz (Box with TT2, GPS, custom board, GPS antenna)
+ additional for 2m antenna, external battery power

Cost:
Motorola GPS: $80 (ham discount at Synergy Systems)
Antenna: $25
Radio: $130
TT2: $30
Yaesu 4-cond. cable $8
Misc parts: $15

Total: ~$288

The only real "homebrew" to this was the board to do the RS-232 level conversion and power regulation. The Motorola Oncore M12 uses 3V TTL logic. To interface more reliably to the computer, I got a MAX232 level shifter to invert the logic and bring the voltages up to RS-232 levels. The Oncore M12 defaults to starting in binary mode, so a computer is needed to command it to NMEA. Once that's done, the on-board battery backup will retain settings for a few weeks. I also have a 74AC04 hex inverter as recommended by several schematics I got, but it may not be necessary.

Since the MAX232 uses 5V logic, a voltage divider is used to drop the signals going to the M12 down to 3V. For data coming from the GPS, 3V logic

is enough to drive the MAX232.

After overnight charging, I plan to test the Yaesu with the tracker to see how long its internal batteries will last with a 30-sec transmit cycle.

I set the timer to 2 hours and some minutes (I forgot how many).
We were on the scene about a minute after landing.

From: Justin Formolo
Topic: 1665 Message: 1665

To All,

I was wondering if Street Atlas 9 is any good in APRS? I believe it is the newest edition. I'm getting ready to purchase a rig so I'm collecting parts and software. Does TOPO 3 work at all with APRS+ or will Street Atlas only work? Thanks

Justin Formolo, KD7PIT

It works just fine with APRS+ and is a nice combination. The author of
APRS+ seems to be very responsive and puts out updates fairly regularly.

>Does TOPO 3 work at all with APRS+ or will Street Atlas only work?

No, the topo map packages and the Street Atlas Deluxe use a different
mapping engine and do not work with APRS+.

Make sure you get SA9 and not SA Deluxe for APRS use.

Bill

Ok thanks. Too bad that TOPO 3 doesn't work. I can see where that
may come in handy!

I haven't tried it, but I think you could save a route file from SA and
import it into Topo. Not as good as running it direct, but worth a try.
(I've got Topo USA and SA 9 so I can try it just haven't had the time yet!)

1670. Amateur High Altitude Ballooning Records, January 2002 quarterly update

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-01 22:41:09 UTC
From: Ralph Wallio, W0RPK
Topic: 1670 Message: 1670

January, 2002 quarterly update of Amateur High Altitude Ballooning Records.
http://users.crosspaths.net/~wallio/records.html

We have been collecting record entries since August, 2000 so these quarterly updates are now developing into a good measure of our collective state-of-the-art. See our records web page for all category entries.

Highest GPS Reported Altitude (ASL)
1. Norm Kjome (KB7ZJT) 20Mar99 120,522ft ASL (SA)
2. SSOK (WB?DRL) 08Jan00 117,460ft ASL (SA)
3. KNSP-99A (KD4STH) 06Feb99 114,399ft ASL (SA)
GPS data for BOI flight to 118,000ft has not been received.
There are rumors of altitude record breaking attempts in 2002.

Lowest Reported Maximum Altitude (AGL)
1. HABET-H30 (ISGC/ISU) 02Mar00 4,903ft AGL
2. HABET-H36 (ISGC/ISU) 30Mar00 13,511ft AGL
3. HABET-H42 (ISGC/ISU) 08Sep00 16,301ft AGL
ISGC/ISU HABET routinely flys multiple balloon altitude hold missions.

Highest Continuous Ascent Rate (averaged over >10,000ft)
1. EOSS-52 20Oct01 1445.4ft/min
2. HABET-L21 (ISGC/ISU) 10Oct98 1435.4ft/min
3. NSTAR-01A (N9XTN) 14Apr01 1384.5ft/min

Lowest Continuous Ascent Rate (averaged over >10,000ft)
1. EOSS-50 (Pioneer Astronautics payload) 21Apr01 221.8ft/min
2. TVNSP 01-D (KD4STH) 30Jun01 326.4ft/min
3. HABET-H43 (ISGC/ISU) 21Nov00 449.5ft/min

Longest Great Circle Distance, Release to Touchdown
1. SSOK (WB?DRL) 08Jan00 703.02 Miles (Floater)
2. NS0-1 (Near Space Balloon Group) 25Mar00 152.73 Miles
3. EOSS-50 (Pioneer Astronautics payload) 21Apr01 138.79 Miles

Shortest Great Circle Distance, Release to Touchdown
1. HABITAT SKYLAB (KA0JLF) 25Sep99 8.71 Miles
2. NSBG-NS1-1 (N3KKM) 28Apr01 9.80 Miles
3. KNSP-99E (KD4STH) 20Jun00 9.89 Miles

Longest Mission In Time, Release to Touchdown
1. SSOK (WB?DRL) 08Jan00 14:01:39>19:28:10 5h26m31s
2. HamBONE-LD1 27Jun01 10:12>14:50z 4h38m
3. BEAR-1 27May00 15:13:33>19:46:36 4h33m03s

Heaviest Payload
1. Project HALO Rockoon (WB8ELK-KE4ROC-K4ZQM) 11May97 92.0 Pounds

2. HABET-H42 (ISGC/ISU) 08Sep00 49.0 Pounds
3. HABET-H43 (ISGC/ISU) 21Nov00 43.0 Pounds

Lightest payload
1. ITA-2 (Into Thin Air/KA2QPG) 19Mar00 0.21 Pounds
2. SQ3 (SkyQuest/N1LTV) 21May00 0.41 Pounds
3. ITA-3 (Into Thin Air/KA2QPG) 04Jun00 0.46 Pounds

Largest Envelope(s) (Fully Expanded Volume)
1. EOSS-50 (Pioneer Astronautics payload) 21Apr01 52,729ft^3 KCI-3000 and 3xKCI-600
2(Tie). HABET-H42 (ISGC/ISU) 08Sep00 40,904ft^3 KCI-3000 and 2xKCI-100
2(Tie). HABET-H43 (ISGC/ISU) 21Nov00 40,904ft^3 KCI-3000 and 2xKCI-100

Smallest Envelope (Fully Expanded Volume)
1. SQ3 (SkyQuest/N1LTV) 21May00 500ft^3 KCI-200

Greatest Telemetry Downlink Reception Range (Two Categories)
VHF/UHF near line-of-sight
1. EOSS-52 20Oct01 KC0IUW & KC0IUY<Telemetry 394.1 Miles
2. ANSR-2 28Jul01 K5LPS & K5RIC<Telemetry 370.7 Miles
3. NSTAR-01D (N9XTN) 30Jun01 KC5ECB<Telemetry 347.3Miles
#1 position approaches theoretical maximum. A major effort might break it.
HF via any mode of propagation
1. ITA-5 (Into Thin Air/KA2QPG) 15Nov00 W6VIO (N5BF opr)<Telemetry 2437 Miles
2. ITA-3 (Into Thin Air/KA2QPG) 04Jun2000 W?RPK<Telemetry 983 Miles
Solar Cycle 23 has peaked but intercontinental record distance on 10m is still possible.

Greatest Two-Way Repeating/Transponding Great Circle Distance
1. EOSS-46 14Jan01 N?KQX<>N7DMO - 526 Miles
2. NSTAR-01B 19May01 KC?AXK<>KC?HFL - 344 Miles
3. HABET-1 (CITS/W?RPK) 04Dec93 AA?W<>N9GQR - 320 Miles
QSO distance record breaking attempts are being planned for 2002.

Ratio of Released v. Recovered Payloads
1. EOSS (Edge of Space Sciences) 53-for-53 18Nov90-01Dec01
2. KNSP (KD4STH) 19-for-19 02Nov96-10Jul99
3. SSOK (WB?DRL) 13-for-13 01Feb92-08Jan00

Longest Recovery Time (any method)
1. Bill Brown, WB8ELK 09May98-04Dec98 209 Days
2. TV-00A (KD4STH) 20May00-08Oct00 141 Days
3. EOSS-50 (Pioneer Astronautics payload) 21Apr01-29May01 38 Days

Touchdown Prediction Closest to Actual Coordinates
1. Eric Hauber ISU/HABET-L53 26Sep01 10kCC 0.23 Miles
2. Bill All, N3KKM NSTAR-01B 19May01 95kNB 1.25 Miles
3. Mark Conner, N9XTN NSTAR-01B 19May01 95kNB 5.59 Miles
See http://users.crosspaths.net/~wallio/HABerr.html for more a complete understanding of touchdown prediction accuracy.

You did indeed. (though lightly attended)

Next meeting is 2 weeks from last Sunday. I think somebody needed it to
stay on an every 2 week schedule. <grin>

Bill

1673. Its ALIVE!

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-02 10:56:45 UTC
From: Rick Widmer
Topic: 1673 Message: 1673

The logfile analysis program should now be working. It provides an easy way to combine multiple APRS log files into one database. If there is interest, I will offer it for your free use. No strings attached, other than please try to learn how to use it yourself so I don't have to mess with it every time someone wants to look at a log. If you find bugs, or ways to improve it, let me know.

http://piemur.developersdesk.com/balloon/

If you can't find an existing file on this site that makes your job of analizing APRS logs easier, let me know, I will probably write it for you. (Ralph Wallio this especially includes you.) Look thru the "Cooked Data File" and "APRS Data" links on the bottom of the flight data pages. The "Analysis Errors" page may be helpful for debugging trackers as it shows any data this program can't understand, broken out by the tracker that sent it.

Anyone who knows this URL can look at filghts that have been uploaded and processed. Click on the Orginizations link, then select a flight to view. Currently the only flights with valid data and names are TV01G and TV01H. The data in TV01H is pretty sparse. If anyone has more data for this flight, or other flights they would like to see, please register so you can upload yourself, or email it to me. If you email it, I need to know the callsign of the tracker that logged the data.

Anyone can sign up to upload files, or to create a group. Just click on the Register link. You will get an email when your request has been approved by the group leader. Just me right now, but I would like to see someone from each group sign up as leader. The leader has rights to edit the orginization and flight names and blurbs, and approve members. Members have the right to upload APRS log files, and trigger processing to create the web pages for a flight.

I still need to get more than one different set of raw data for a flight so I can work on the program that combines them and removes duplicate records.

Rick

P.S. John Stone, the membership you signed up for is now active. Have fun!

P.P.s. The program/web site will be moving in a couple of weeks. I need to upgrade my web servers before I move it off this development machine. When it goes away the new URL will be:

http://www.mvas.net/balloon/

There will be a link on the development machine for a few weeks after it moves, but I don't gurantee when the machine will be online. (That's why it is a development machine.) Please don't link to the development site, but you are free to link into the site once it moves to the mvas.net domain. (Link into - provide links on your site to pages inside this site. Some people don't allow this.)

It's official, TVNSP is now a SIG of VOI. The next VOI meeting is next Wednesday. Everyone who is a paid member of VOI falls under the umbrella liability insurance the club owns. So please attend the next meeting and join. The cost is $20 and you don't need to be a ham. To protect yourself, please pay your membership dues before the next launch.

I owe VOI an activities plan and budget. I'm including a copy of what I wrote at the bottom of this email. Please look it over and make suggestions. I also owe them a set of operational rules. I'm attraching a copy of my chapter 12, on FAR 101. We'll need to add prediction rules, which John the Elder has started. John, when you're done, we'll include your rules with chapter 12 and make that our operational plan. As long as flights conform to the ops plan, they'll be covered.

We should probably keeps files on TVNSP. Let's develop a standard for the data saved for each flight. Right now John the Younger generates a checklist and sign-up sheet. I propose those be kept for each flight. John the Elder is working on a prediction process. I also propose the work sheet be kept. We should proabaly also keep a copy of the flight log on diskette. How about photos? Also, where do we keep the files? I'm willing to buy a file box and folders when we're ready.

A set of meeting minutes will be published on the VOI webpage shortly. We'll need a copy of them for the TVNSP files. I'll also get a copy of the insurance that we can show to the mall the next time we try to set up a display. I'd like to do this in the spring and leave a capsule out for donations.

VOI will have a item for the program in their budget. If you know someone who would like to donate, they can send the check to VOI. Doug, is there anything special that needs to written ont eh check? also, what address should it be sent to?

I'm ordering patches for TVNSP. They'll probably cost less than $9 each if we order 100 of them. I'll take ten for myself right off the bat. I need people to commit to purchasing some patches.
They're 3" in diameter and can be sewn on jackets, hats, capsule abrasion jackets, rabbits, etc.

I'll also get a copy of the artwork for the webpage and for a new set of business cards.

Mike, can we still get the TVNSP domain name? I'd alike to arrange that with Doug and get it put on the new business cards. We'll still keep the weboages on the-one, we just need to alias the name (is that the right term?).

The next TVNSP meeting is the following Sunday, not this Sunday. We meet at the hobby Town on Cole and Ustick. The meeting time is 2:00 PM. Bring your projects or start a new one. Justin, what would you like to start building? I'll bring stuff to make cutdown devices and timed beacons. That will be the first solder project we'll have. We have htree airframes and one parachute being built. Bring your APRS gear if you'd like. I'll arrange to bring a CC/PS that we can test it on. There will also be another Basic Stamp lesson. Mike will you be there? Do we need to bring a sewing machine? Jeff, can you bring your wife's? (I suspect it's not your's).

I mentioned writing magazine articles. I sent one to ATVQ about why we near space. We need to expand on it. Gene Harlan, editor and publisher of ATVQ has asked for a series of articles about amateur near space exploration. I'd like to see members of TVNSP write those articles. We get paid for them, so there is also a financial reward (it will get you dinner out). My recommendations were as follows (but please feel free to disagreee or to improve upon them).

Jeff and an article on building a basic tracker for capsules
John the Elder on predictions
John the Younger on launch procedures
Deb on filling the balloon (oops, John, did you ask your wife first?)

There are many other topics. Mike, Justin, and the two Bills, do you have topics you'd like to write about?

I'd like to see TVNSP Team Members write an article per issue of ATVQ about near space.

I've started digitizing video. I can record images, but not sounds. I may ask for help if I can't get this fixed. I make a 9 minute video on flight TV01H. It's currently stuck on the PC as a 112 MB mpeg. As I said, there's a few details I have to figure out yet. Eventually I make short movies of each flight (cut out the boring stuff) and a set of videos on amateur near space exploration.

Is there anymore?
Paul

****
Activities Plan For the Treasure Valley Near Space Program (TVNSP)

TVNSP breaks their activities into three broad categories.
1. Biweekly Meetings

2. Displays
3. Launches

Biweekly Meetings
Biweekly meetings concentrate on the following activities
(Construction of near space stack elements
(Construction of support equipment
(Procedures

Construction of stack elements involves building the following items, capsule airframes, the CC/PS flight computer, experiments, simple capsule trackers, recovery systems, and flight termination systems. Construction of support equipment involves building the following items, launch site support equipment, balloon filling equipment, stack launch equipment, and tracking equipment (usually mobile). Procedure activities cover training for launches, review and practice of launch activities, and documentation of procedures.

Displays
There are two classes of displays TVNSP supports
(Stand-alone
(Manned

Stand-alone displays are usually as simple as a poster. Manned displays can be as simple as a booth at the mall, or as complex as mission control during a flight. Stand-alone displays are found at radio, science, hobby, or electronic stores. Manned displays occur at the mall, DCI, or schools. Upon request, displays can be made available for other locations.

Launches
Typically TVNSP launches one mission per month between the months of March and October. Most flights take place at sunrise on Saturday, although a few many take place at night (to record meteors or sunrise from near space). During June or July there may be a remote launch in the Midwest in support of the Great Plains Super Launch (GPSL). All launches are open to the public and may be performed on the request of an interested party. Those interested in near space may design their own experiments for flight as long as they adhere to TVNSP requirements (power, weight, and form factor). All data from flights is available to the public, although the PI of each experiment has exclusive right to their data for a period of eight weeks.

Launches are announced in advance on the TVNSP email list. Final mission details are determined at the prelaunch dinner, the night before each launch. All mission participants are strongly encouraged to attend the prelaunch dinner.

****
TVNSP Budget

There are two types of costs involved with a near space mission.
(One-time costs
(Expendables

One time costs involve the construction of the near space capsule, experiments (except of recording media), recovery systems, and flight termination systems. Each TVNSP team member takes care of the one-time costs involved with their element of the mission.

The range of expendable costs of each TVNSP mission breaks down as follows

Balloon: $50 to $200
Helium: $100 to $114
Film: $3 to $6
Video Tape: $5

Most flights will be no more expensive than about $160. This means a flight using a 1200-gram balloon, 1.5 tanks of helium, one roll of 35mm or APS film, and a HI-8 videotape. This combination allows a near space mission achieve altitudes approaching 90,000 feet. Rarely will TVNSP use the more expensive 3000-gram balloon (which also increases the cost of helium required). In these special mission flights, there is a contributor that TVNSP is flying the mission.

There are approximately six missions per year. Currently, TVNSP team members pay most mission costs. However the Idaho Space Grant Consortium, local amateur radio operators, and amateur radio clubs have contributed to flights in the past.

A typical year of missions for TVNSP can cost $1000.

1679. [tvnsp] Articles (was [tvnsp] Odds and Ends)

Yahoo group: tvnsp (2000 — 2002)

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 1679 Message: 1679

A lot to read and digest in the entire document, so I'll comment on that later on.

As to this particular item...

> There are many other topics. Mike, Justin, and the two Bills, do
> you have topics you'd like to write about?

The other Bill was trying to twist my arm about writing about weather prediction. I'm game to try an article on this, but want to clarify some things.

First, we need a copy of the guidelines for writing the articles. Every magazine has these readily available to budding authors, and they are vital to getting the articles accepted. They list the word counts desired, content styles, picture requirements, and all that other stuff that cuts down editing time and helps you quickly produce a usable article for that magazine. Some magazines require you to provide a blurb or outline describing the article you want to write so that both of you don't waste time with an article that's not useful for them.

Second, regarding the weather article itself, as I said, I'm game. This article would primarily be oriented towards understanding the weather from the ground. There are several obvious reasons why this would be useful. I could also, though I suspect others can do this one easily enough, include information on reading weather maps.

Bill B.

Paul,

I obtained the domain name www.tvnsp.org back on 11/20, I paid for 1 year, but am willing to donate the domain to the Cause. Let me know the details on what needs to be done for this to be integrated into the our plan.

About the sewing machine, Yes, there needs to be a sewing machine brought to the next meeting(s) for me to continue on my parachute construction.

By the way, Happy New Year to all, hope to have a great year full of fun filled near space missions!

See you all at the next meeting!

Mike KC7DPD

Mike, can we still get the TVNSP domain name? I'd alike to arrange that with Doug and get it put on the new business cards. We'll still keep the weboages on the-one, we just need to alias the name (is that the right term?).

One place flight logs should be kept is on the web site.

> We'll still keep the weboages on the-one, we just need to alias the
> name (is that the right term?).

It looks like that domain is hosted at Safelink. They can setup the server so hits to the domain name will go thru, but unless you have an account with them already, they will probably want to charge you for the privelege. Unless you or your friend at the-one is already on the Business Enhanced (69.95) program you are looking at a 10MB limit on web space at Safelink.

http://www.safelink.net/rates.htm

I think you will probably find that you are better off putting the pages on the new server, and putting a redirect page on the old site. As long as you own the tvnsp domain name you can put it anywhere you want. The-one looks like a personal site that could easily go away, and if you have lots of people with links to it when it does they are lost.

Since you don't think 10MB is enough, I'll sweeten the pot. How about 50MB for a year for a t-shirt and a patch*. Remember this also includes email addtesses under your domain for all members, and the ability to host your mailing list there, with no advertising in the messages or on the web site where you can review the archive.

* If you don't do the patches, you don't owe me one.

Rick

Just indicate on the check it is for the "balloon fund". The address is
P.O. Box 812, Boise, ID 83701
Also there is a membership for on the VOI web site
http://www.voiceofidaho.org/ under "club info".

Now that the VOI is involved we would like to setup the new domain at Big
Sky Telecom. They have provided us with web space at no charge. I believe
they will host the TVNSP.com domain also. I can put a link on the old home
page with forward information and a link to the new home.
It could, also, be hosted anyplace and visitors to the VOI site would not
know it was housed elsewhere.

Cool. My main concern is that the pages should be hosted under the
TVNSP.com domain for portability.

Hey Paul, right now I'm busy building my rig for tracking. I'm in the middle of getting my hands on a Kenwood D700A and sorting out what GPS unit I want, then become familiar with it before the first flight. I was just curious when meetings are held and when. That's great we are now under VOI so I'll get my dues in ASAP. I will probably stop by on Sunday the 13th and see how things are going along. I will also think up some project ideas for building with the rest of my break before spring semester starts. What sort of flights are you planning on for this year?

Justin Formolo, KD7PIT

Subject: [tvnsp] Odds and Ends

It's official, TVNSP is now a SIG of VOI. The next VOI meeting is next Wednesday. Everyone who is a paid member of VOI falls under the umbrella liability insurance the club owns. So please attend the next meeting and join. The cost is $20 and you don't need to be a ham. To protect yourself, please pay your membership dues before the next launch.

I owe VOI an activities plan and budget. I'm including a copy of what I wrote at the bottom of this email. Please look it over and make suggestions. I also owe them a set of operational rules. I'm attraching a copy of my chapter 12, on FAR 101. We'll need to add prediction rules, which John the Elder has started. John, when you're done, we'll include your rules with chapter 12 and make that our operational plan. As long as flights conform to the ops plan, they'll be covered.

We should probably keeps files on TVNSP. Let's develop a standard for the data saved for each flight. Right now John the Younger generates a checklist and sign-up sheet. I propose those be kept for each flight. John the Elder is working on a prediction process. I also propose the work sheet be kept. We should proabaly also keep a copy of the flight log on diskette. How about photos? Also, where do we keep the files? I'm willing to buy a file box and folders when we're ready.

A set of meeting minutes will be published on the VOI webpage shortly. We'll need a copy of them for the TVNSP files. I'll also get a copy of the insurance that we can show to the mall the next time we try to set up a display. I'd like to do this in the spring and leave a capsule out for donations.

VOI will have a item for the program in their budget. If you know someone who would like to donate, they can send the check to VOI. Doug, is there anything special that needs to written ont eh check? also, what address should it be sent to?

I'm ordering patches for TVNSP. They'll probably cost less than $9 each if we order 100 of them. I'll take ten for myself right off the bat. I need people to commit to purchasing some patches. They're 3" in diameter and can be sewn on jackets, hats, capsule abrasion jackets, rabbits, etc.

I'll also get a copy of the artwork for the webpage and for a new set of business cards.

Mike, can we still get the TVNSP domain name? I'd alike to arrange that with Doug and get it put on the new business cards. We'll still keep the weboages on the-one, we just need to alias the name (is that the right term?).

The next TVNSP meeting is the following Sunday, not this Sunday. We meet at the hobby Town on Cole and Ustick. The meeting time is 2:00 PM. Bring your projects or start a new one. Justin, what would you like to start building? I'll bring stuff to make cutdown devices and timed beacons. That will be the first solder project we'll have. We have htree airframes and one parachute being built. Bring your APRS gear if you'd like. I'll arrange to bring a CC/PS that we can test it on. There will also be another Basic Stamp lesson. Mike will you be there? Do we need to bring a sewing machine? Jeff, can you bring your wife's? (I suspect it's not your's).

I mentioned writing magazine articles. I sent one to ATVQ about why we near space. We need to expand on it. Gene Harlan, editor and publisher of ATVQ has asked for a series of articles about amateur near space exploration. I'd like to see members of TVNSP write those articles. We get paid for them, so there is also a financial reward (it will get you dinner out). My recommendations were as follows (but please feel free to disagreee or to improve upon them).

Jeff and an article on building a basic tracker for capsules
John the Elder on predictions
John the Younger on launch procedures
Deb on filling the balloon (oops, John, did you ask your wife first?)

There are many other topics. Mike, Justin, and the two Bills, do you have topics you'd like to write about?

I'd like to see TVNSP Team Members write an article per issue of ATVQ about near space.

I've started digitizing video. I can record images, but not sounds. I may ask for help if I can't get this fixed. I make a 9 minute video

on flight TV01H. It's currently stuck on the PC as a 112 MB mpeg.
As I said, there's a few details I have to figure out yet. Eventually I make short movies of each flight (cut out the boring stuff) and a set of videos on amateur near space exploration.

Is there anymore?
Paul

****
Activities Plan For the Treasure Valley Near Space Program (TVNSP)

TVNSP breaks their activities into three broad categories.
1. Biweekly Meetings
2. Displays
3. Launches

Biweekly Meetings
Biweekly meetings concentrate on the following activities
(Construction of near space stack elements
(Construction of support equipment
(Procedures

Construction of stack elements involves building the following items, capsule airframes, the CC/PS flight computer, experiments, simple capsule trackers, recovery systems, and flight termination systems. Construction of support equipment involves building the following items, launch site support equipment, balloon filling equipment, stack launch equipment, and tracking equipment (usually mobile). Procedure activities cover training for launches, review and practice of launch activities, and documentation of procedures.

Displays
There are two classes of displays TVNSP supports
(Stand-alone
(Manned

Stand-alone displays are usually as simple as a poster. Manned displays can be as simple as a booth at the mall, or as complex as mission control during a flight. Stand-alone displays are found at radio, science, hobby, or electronic stores. Manned displays occur at the mall, DCI, or schools. Upon request, displays can be made available for other locations.

Launches
Typically TVNSP launches one mission per month between the months of March and October. Most flights take place at sunrise on Saturday, although a few many take place at night (to record meteors or sunrise from near space). During June or July there may be a remote launch in the Midwest in support of the Great Plains Super Launch (GPSL). All launches are open to the public

and may be performed on the request of an interested party. Those interested in near space may design their own experiments for flight as long as they adhere to TVNSP requirements (power, weight, and form factor). All data from flights is available to the public, although the PI of each experiment has exclusive right to their data for a period of eight weeks.

Launches are announced in advance on the TVNSP email list. Final mission details are determined at the prelaunch dinner, the night before each launch. All mission participants are strongly encouraged to attend the prelaunch dinner.

****
TVNSP Budget

There are two types of costs involved with a near space mission.
(One-time costs
(Expendables

One time costs involve the construction of the near space capsule, experiments (except of recording media), recovery systems, and flight termination systems. Each TVNSP team member takes care of the one-time costs involved with their element of the mission.

The range of expendable costs of each TVNSP mission breaks down as follows

Balloon: $50 to $200
Helium: $100 to $114
Film: $3 to $6
Video Tape: $5

Most flights will be no more expensive than about $160. This means a flight using a 1200-gram balloon, 1.5 tanks of helium, one roll of 35mm or APS film, and a HI-8 videotape. This combination allows a near space mission achieve altitudes approaching 90,000 feet. Rarely will TVNSP use the more expensive 3000-gram balloon (which also increases the cost of helium required). In these special mission flights, there is a contributor that TVNSP is flying the mission.

There are approximately six missions per year. Currently, TVNSP team members pay most mission costs. However the Idaho Space Grant Consortium, local amateur radio operators, and amateur radio clubs have contributed to flights in the past.

A typical year of missions for TVNSP can cost $1000.

1686. Getting a glider back to launch site

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-04 00:41:34 UTC
From: Rick Widmer
Topic: 1686 Message: 1686

It seems I remember someone talking about trying to build a glider and fly it back to the launch site. Well its been done, and the glider found its way back to the launch site by itself.

http://members.shaw.ca/sonde/launch_2.htm

Some interesting quotes from the web page:

"Soon after the release, when it was obviously flying itself properly, the autopilot was
commanded to fly a "panorama turn" - a 360 turn with photos taken every 45 degrees,
which worked great. The "Expert" high-level autopilot then guided the glider back
down to the landing site without help from the ground station, although the autopilot
turn-gains were experimented with a bit (to no noticeable effect)."

"It landed gently, only 65m from the launch point. Not bad at all."

"Two years of work to get to this point!"

Craig-

Looks like the funnest job in the world. Were Wilbur and Orville sized quite differently from each other? The pictures don't have all the clues. Wilbur looks small. What's the displacement on that engine on the mothership? I can't tell if it's in the standard class or if it's one of the Big Super Tiger or OS 2 cycle jobs. Orville is quite large. Does it exceed 20 pounds? Is that wing flexible enough to Flap? How does one get a job like yours?

1691. chip to acquire temperature.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-04 18:47:30 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1691 Message: 1691

http://www.the-one.com/tvnsp/99aenvir.htm

The Air temperature data from this URL specifies that
the ambient air temperature goes as low as -70'F as the nearcraft
passes through the tropopause.

I was looking for an inexpensive solution for temperature
acquisition... I came across the DS1620 (around $3.50)
its specified range of operation is:
257'F to -67'F...

Anybody know of an inexpensive IC that would go as low as....
say -80'F... Also if you could suggest a source to buy
one, that would be helpful... a URL or something...

I thought it would be fun to test some nearcraft designs in
a chamber my team uses here... it goes from 200'F to -75'F
Perfect for nearcraft thermal analysis....
If anyone has a craft they would like to test let me know,
it would be fun to see how various designs do ...

I was thinking something along the lines of a standard test
to compare designs.... like setting the chamber to -50 and plotting
the drop of "cabin" temperature over time... say out to a few hours... to
see if it hits an equilibrium, where the equipment heat balances the heat
loss of the "cabin"....

What are the dimensions of Paul's "standard" nearcraft? I think our
chamber is barely larger that the craft at:
(exactly) 11"x12"x16". (Depth x Height x Width)

My goal in all this is to explore the lightest nearcraft design
possible while maintaining acceptable temperature and structural
requirements (I suppose landing would be the most destructive).

I don't believe ATV Quarterly has a guideline. I've never used on
when writing articles for Mr. Harlan. I inmagine that if he has one,
it will be available on his webpage.

Paul

1693. Re: [tvnsp] chip to acquire temperature.

Yahoo group: tvnsp (2000 — 2002)

I use an LM335 and digitize the voltage with a MAX186. We have used thermochrons which have a built in memory, thermometer, and clock. However they only drop as low as -40F. On the plus side, temperatures inside the near space capsule usually don't drop below freezing.

We've used a refrigerator as a thermal chamber in the past. This would be upscale for TVNSP and appreciated. We'll built a set of capsule airframes a little smaller than typical for the test. We can add varying amounts of MLI as part of the test.

> What are the dimensions of Paul's "standard" nearcraft? I think our
> chamber is barely larger that the craft at:
> (exactly) 11"x12"x16". (Depth x Height x Width)

They tend to be 10 by 10 by 12 or 12 by 12 by 12.

But we can modify them (where's that hammer?).

Paul

1694. .COM vs .ORG

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-04 22:36:10 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1694 Message: 1694

Is there a difference for us if we use tvnsp.org vs tvnsp.com?

Doug, I guess I need to see about getting the webpages moved over.

Paul

From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1691 Message: 1695

Excellent, that will be a fun project.
I'm free this weekend and next weekend.
My cell is 866-5633. How would you like
to arrange the transfer of the capsules?

I'll look into the chip you suggest.
Over lunch i came across a diode design....
http://home.elp.rr.com/brewbeer/Thermo/#Homebrewed%20Thermometers
<http://home.elp.rr.com/brewbeer/Thermo/#Homebrewed%20Thermometers>
I really like it because it is simple and cheap.
I'll play around with it in the chamber and see how linear
it is over the range of interest.

I have found in the past that the yearly fee for .com was higher than a .org. You might check on that.

Mile Garske already owns the tvnsp.org domain and has offered to let the club use it. The cost seems to depend on who you register with. The last time I looked they were all the same price. I think .org is by far the best choice for TVNSP as it fits in well with the type of orginization.

1705. Thermal Testing

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-07 23:25:58 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1705 Message: 1705

At this Sunday's meeting, I'd like to make a couple of mini airframes. We'll use different types of insulation to cover them and then run thermal tests at HP. Jeff, do you have two thermochrons? I think I have a third. This will allow us to run the capsules to lower temperatures. We'll have to switch the t-chrons around, as we know we have a bad one.

Jeff, did you save the email from this summer ordering thermochrons? I need to call Dallas and see why our order is taking so long.

Paul,

As I mentioned before to you in email, the Dallas/Maxim
Thermochron situation is just terrible and getting only
worse.

There will be no Thermochrons shipped until March 2002 at
the *earliest*, no matter when your orders were made.

Anyone who has these should consider himself lucky, AND
you should disable any missions that may still be running,
since total measurements made determines the remaining
battery life.

I imagine we wouldn't have enough time. I'm thinking we'll need to use the meeting to get the capsules built.

The thermochrons will read data for 1.4 days. I think we'll program them in advance for you and then let you do your thing.

Paul

1709. GPSL 2002

Yahoo group: tvnsp (2000 — 2002)

From: verhap@occ1.sd01.k12.id.us
Topic: 481 Message: 1709

GPSL 2002 has a site for its mini-symposium. The Hale library at K-State has informed me that they have space for us (thanks, mom). The 4th of July is on Thurdsay. All those not suffering from second and third degree burns are invited to participate in the symposium and launch. The symposium will be held at the library on Friday. The doors open at 7:30, which will be our set up time. The symposium will begin at 9:00 AM sharp. Some snack type foods will be provided. Lunch is on your own, but I recommend either the campus cafeteria or a restuarant in Aggieville.

Kansas State University is located in beautiful Manhattan, Kansas. Manhattan is about an hour west of Topeka, the capitol. There are plenty of hotels available in Manhattan and Junction City. I'll put a packet together.

I'd like to line up speakers at this time. I assume all program managers would like a chance to speak. Please confirm this with me and your topic. Ralph Wallio has also expressed an interest, Ralph, what would you like your topic to be?

At this time, NSBG, NSTAR, HABITAT(?), and TVNSP have expressed in interest in attending. Are there other balloon groups? For instance, Zack's group, EOSS, or BOREALIS?

After Friday's mini we'll head out to the Johnson Near Space Center for capsule assembly and testing. Saturday, one hour before sunrise we'll open the doors again and begin filling balloons. The hope is to launch more than three balloons at one time. I'll also start lining up media coverage. Any help here would be appreciated.

More information will be forth coming. Any suggestions or ideas would be appreciated.

Paul

Paul,

I'll bring the two thermochrons.

Did you graph the results of the thermochron testing I sent you?

I checked but I don't have the email order.

FAR 101 allows us to send two, six pound capsules up on a balloon (that is if we want to keep it simple). There's no mention of parachute weights in FAR 101. I'm interested in getting feedback about putting some of the cpasule weight into the parachute and removing it from "capsule weight".

Things like audio beacons, I feel, are legitimately recovery aids and appropriately placed on the parachute ring. So if I have 1/2 or 1 pound of recovery aids and move them to the 'chute, does that still leave 12 pounds for my capsule?

Paul,

Attached are two files. One is BNM.txt. It is the black thermochron. The other is the yellow thermochron. It is YMN.txt. The black thermochron was first placed in the box with no mylar then placed in my large freezer. The yellow thermochron was placed in the box with mylar and also placed in the freezer at the same time. They were both removed from the freezer and placed in room temperature for a long time. Next I swapped the thermochrons so that the black one is now in the box with mylar and the yellow one is in the box with no mylar. I placed them back in the freezer. After some time I removed them and let them warm up to room temperature. I downloaded the date. I also placed a mercury thermometer in my freezer and checked it a few times (not while the experiments were running). It indicates that my freezer runs about 0 to -6 degrees Fahrenheit. All we need is an interpretation of the results.

The file named BNM means Black thermochron, No mylar on the first run, Mylar on the second run.
The file named YMN means Yellow thermochron, Mylar on the first run, No mylar on the second run.

The small boxes were constructed by Paul. They are made of 1/2" blue Styrofoam. One is wrapped by 3 layers of mylar separated by scrim. Both are covered by black construction paper. The inside diameter is 3 inches cubed.

Paul,

I probably would not be able to go. My family has a 4th of July tradition that we attend with some friends. I would like to see some members go with you. It's probably easier for single people but work and time demands also play a role. It's definitley easier for teachers to plan trips like this. :)

Hmmm...

Perhaps this is a matter of interpretation. Does it say capusles or payloads? You can also send up three, four pound payloads. Can the 1 pound of recovery aids be defined as payload?

FAR 101 doesn't define the term payload. When it speaks of
payload weights, it ignores parachutes (recovery systems).

Uh, does it ignore parachutes? My interpretation of it is that
anything that ain't balloon is payload. Otherwise we could include any
of the APRS gear as recovery systems and exclude it from the the weight
totals if we were to not include it in the "payload package".

I think the intent of Part 101 is to provide an upper bound of the
amount of airborne weight before a waiver and ATC approval is needed.
The FAA may not care if the weight is in a payload package or hanging
on a spreader ring.

1719. Thermal testing this sunday

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-12 04:34:19 UTC
From: Dave Lastname
Topic: 1719 Message: 1719

This is Dave Ritz.

I am with my wife this weekend in Pullman where she lives. She is finishing her degree at WSU, which would
explain why I have so much time for these type of experiments eh?
I'll be back in Boise around 5-6pm on Sunday.
Again my cell is 866-5633. I'm happy to swing by and grab the nearcrafts for the thermal experiment..
or perhaps we can just plan on meeting at HP at say 6pm? I'm happy to do it myself and also happy to have
others come help/watch/learn whatever. Company is always welcome.

The thermal chamber takes a good 20 minutes to get as low as -60C. And it can go as low as -75C.
Do you guys have an idea of what kind of thermal routine you'd like to have performed?
Perhaps just run it down to some low temp and leave it there for an hour? Just let me know
and I'll get it done, and then again maybe some of you will come along?

I can be contacted this weekend at 509-332-7698 to work out the details if needed.

At this Sunday's meeting, I'd like to make a couple of mini
airframes. We'll use different types of insulation to

cover them and
then run thermal tests at HP. Jeff, do you have two
thermochrons?
I think I have a third. This will allow us to run the
capsules to
lower temperatures. We'll have to switch the t-chrons
around, as
we know we have a bad one.

Jeff, did you save the email from this summer ordering

thermochrons? I need to call Dallas and see why our
order is
taking so long.

The capsules take about 1 hour to drop to -60 F. For the following hour, the air temp rises about 30 degrees. Then the balloon bursts. At that point the wind passing over the capsule increases its effectiveness at carrying away any heat.

Topic: 1721 Message: 1721
Attachments: 1 described; binary payloads are missing from this source WARC

Just as a follow up... the simple diode implementation for a thermometer
was perfectly linear over the range -60 to 40 Celsius using a 2N3904 (NPN)
transistor.
Please see the attached spreadsheet.... for the details
<http://home.elp.rr.com/brewbeer/Thermo/#Homebrewed%20Thermometers>
http://home.elp.rr.com/brewbeer/Thermo/#Homebrewed%20Thermometers
Currently I'm using an analog to digital converter to capture this data...
my current implementation is using a basic stamp 2sx, an analog mux, and a
A2D...
it is a fairly bulky and relatively power inefficient solution with lots of
jumper
wires running all over the place.
I went to a pic chip demo yesterday.... there are a few models of pic chips
that have all
of the above (And more) onboard. They also are capable of operating far
below zero
(industrial/military spec). The only downside is that they have to be
programmed in
assembly (unless you want to fork out another $200 for the C compiler). The
pic chips
are also a fraction of the cost of a basic stamp. I am getting a quote for
the dev kit
and pic chips next week and should have them here in a few weeks....
One amazing feature of the software (free online) is that you can develop
code and TEST
it with the software as though you are really attached to the pic chip...
allowing for development
without even having a pic chip or dev board. Talk about a head start....

I use an LM335 and digitize the voltage with a MAX186. We have
used thermochrons which have a built in memory, thermometer,
and clock. However they only drop as low as -40F. On the plus
side, temperatures inside the near space capsule usually don't
drop below freezing.

We've used a refrigerator as a thermal chamber in the past. This
would be upscale for TVNSP and appreciated. We'll built a set of
capsule airframes a little smaller than typical for the test. We can
add varying amounts of MLI as part of the test.

> What are the dimensions of Paul's "standard" nearcraft? I think our
> chamber is barely larger that the craft at:
> (exactly) 11"x12"x16". (Depth x Height x Width)

They tend to be 10 by 10 by 12 or 12 by 12 by 12.

But we can modify them (where's that hammer?).

We have four test articles in process of being completed. Next meeting we'll wrap them in MLI of alumized mylar and nylon mesh as an interlayer.

We'll use a single thermochron on these tests.

We got a lot done. Mike, when I sew parachutes, I fold the seams over first. I use finger nails to put a sharp crease in the fabric. That makes interlocking the gores easier.

I have printed 100 trifold brochures on near space. 100 more will be printed this week.

Astronomy Day is April 20th. I've emailed DCI and asked if they were interested. Bruneau Dunes expressed an interest also, so I emailed them also. In both cases we'll need to set up a mission control.

I'd still like to launch ATV for Twin.

If we made these the first three launches, that would give us launches for March, April, and May.

I'll be on vacation and doing GPSL 2002 during June and July.

I'd like to try meteors again in August. Somewhere in here I'd also like to do a morning launch to record sunrise from above 75,000 feet.

Any inputs?

Paul

Just for the fun factor, it might be interesting and fun to do the morning launch on either the Equinox or the Solstice.

We're going to need a more stable platform to capture the sunrise, won't we? That would be more effective than catching the sunrise on the fly as it spins around.

That wouldn't apply to the meteors, I'd think. Having it spin around might actually be an advantage for meteor hunting. Seeing the meteors from all angles as they interact with the atmosphere could be interesting.

So plan for a 21 September launch?

Slow spinning is alright. With my luck, if we stopped the spin,
we'd be pointing in the wrong direction.

I've got a 1200g balloon from last year laying around yet. The only problem is that it set in a van for a day or two last summer and has since turned colors. Is it a goner?

Thanks,
Zack

My only concern is a night launch from Twin Falls again. We should be able to make a decision on where to launch from (general area) by Wednesday of the week. I think we need to look at Launching from the Twin Area or the Boise area. For for some reason the Twin Area has not been a nice place to launch from. Some thought will need to go into this. Also a practice night launch and recovery would also be in order. It is totally different than during the day.

Since we want to fly ATV for Twin, we need to make that a day launch. We'll do the night launches from our backyard.

This is Paul Verhage witht he BAS and the high altitude balloon
program. We're beginning to plan our launch season for 2002. WE
hope to launch for DCI on Astronomy Day. Last year a ranger
expressed an interest in having us launch from the park and
operating a mission control. I would like to find out if you're still
interested. We start launching in March. April's flight might be
with DCI. May is still open. In June and July we'll probably be
launching in the midwest. August, September, and October are
open.

Let me know anf thanks for your time,
Paul Verhage

So when you say "ATV" do you mean Amateur Television? Are you going to transmit live video from the balloon? What are you using for batteries and how long do you expect the transmission to last? With the wider bandwidth of a TV signal, all the TV transmitters I'm familiar with really drink the juice. Are you running slow scan TV?

I have a pocket sized 5 or 15 watt 3 channel fast scan TV transmitter that might be suitable for a balloon flight. It transmits on one of three channels (switch selectable) in the UHF band at about 425 to 434 MHz. This means that the signal can be received on any "cable ready" TV. I also own a twelve element phased receiving array and some suitable preamps and a rotor system for receiving ATV. I once sent a TV signal 56 miles (mountain top to valley) with less than 5 watts, but that was with a beam on the transmitter too.

If we do a launch from the River Festival we need to get it planned early because it may require a waiver under FAR 101. Since VOI has a working relationship with the River Fest, this should not be a significant problem.

Yep, amateur TV. I've sent it a few times back in Kansas. The
one watt TX I have runs an entire flight. however, the video quality
drops pretty fast. Your ATV TX is much more powerfult hat what I
have. Can you weigh it and its batteries?

I've also run slow scan. I used the VC-H1 visual communicator and
had reception from over 100 miles.

I'll post the frequency we need to transmit on. Twin has an ATV
repeater, so we want to be close to them when we launch.

Paul,

I may be asking what others are also thinking that don't
get to any of your local meetings. Can you put a photo
or sketch of the design on the web somewhere?

Maybe you're just asking to get a general idea of demand
and the design hasn't even been established yet.

Sorry if I'm out in left field on this.

Hello Paul,

I don't really have a very good way of weighing my transmitter. I'll see
if I can figure something out. Batteries are external, so its what ever
you want to connect that will deliver 12 volts at 1/2 to 3/4 of an amp.

I'm familiar with the ATV repeater on Mount Harrison above Twin Falls. My
friend Lee Kelly keeps it running. I went to the hill with him last
July. As I recall, that repeater takes a UHF signal in and transmits back
out on a much higher frequency like 900 MHz or 1.2 GHz. At least my
transmitter is in the right band to use their repeater. Do you know the
input frequency of the ATV repeater? Guess I should ask Lee.

Looks like more mail from you to read.

Paul,

The transmitter without batteries weighs 340 grams. The amplifier that turns 5 watts into 15 weights 430 grams. More watts gets us more range, but less time, so we might not need the range. Then again, with a sub-optimal omni-directional antenna on the balloon we may need all the help we can get. If we can really get into the repeater there's no need to run much power.

My receiving array is fairly portable, and broadbanded too, so we might use it if we can't get into the repeater. We might want to use it anyway. With the repeater, there would be omni-directional antennas without much gain on both ends. At least with a beam array and a receive preamp on one end you might see a better picture than off the repeater. The repeater can only transmit as good as it gets, so if the incoming signal is marginal, ...

I don't know how 340 grams plus battery fits in with your payload, but its something to think about.

Tony

1747. Re: [tvnsp] 2002 Launch Season

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-18 07:02:45 UTC
From: Tony Barrett
Topic: 1726 Message: 1747
Attachments: 2 described; binary payloads are missing from this source WARC

I've got some 4 amp hour lead-acid gel cells that weigh over a kilogram. My catalog says 1.74 kg (3.84 lbs.) Even my 1.9 amp hour gel cell weighs over 500 grams. And at a 3/4 amp discharge rate (5 watts), even a 4 amp hour cell is only good for about 3 hours according to the load lines in my catalog.

We can get 4.4 amp hours of nicads for about 1.4 Kg. Not a huge improvement. NiMH would be just under 1 Kg, and I'm not sure they can supply that much current - even with the amp hour rating. They tend to sag under load big time. We're talking some big bucks too ($85) unless someone can find a good deal on a couple of NiMH camcorder batteries.

Hmm ... I found some NiMH cells rated for discharge at up to 10C. Maybe these wouldn't sag. $95, 3 AH, 13.2 volts, 605 grams, plus we'd need a special charger. These cells would get us 4 hours theoretically. I'm not sure how they do at lower temps.

Anyone have a catalog on Lithium ion batteries? Even bigger bucks I'll bet.

At -20 degrees C the battery capacity for lead acid gel cells is only 50%, so if the battery gets cold at altitude, we may only get an hour of transmit time.

Seems like a lot of weight and dollars to see it now instead of waiting for the tape. Are there good reasons to see it live?

Tony

I think the FAR concerns regard having stuff drop off the capsule,
early in the flight. I think that if TVNSP launches on the downwind
side of a open field, we will meet the requirements of FAR 101.

Paul

Both packages are less than a pound each. Add a hefty battery
and we might be talking about 3 pounds total. That's doable. I'd
recommend we fly the ATV in place of the camcorder in a later
flight. I'd like to use the camcorder on the next flight (with Jeff's
consent) because I hope to use a 3000 gram balloon. I don't think
anyone has video above 100,000 feet which is what we should be
able to get. I also hope that Jeff and I can design a rotating mirror
for his camcorder.

Paul

How cold do you think the batteries will get during the flight? Should we
do some chamber experiments or put the batteries in a freezer for some
characterization tests?

It can drop to 32 F during the flight. We'll put the batteries into a
foam box for moe insulation, or park them next to the TX for
additional heat.

1760. Patches

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-18 19:03:47 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1741 Message: 1760

The patches will be here on Jan 30th. The total cost will be $7.30 with tax.

I've ordered 100 of them, so please purchase lots of them. I would like to try selling remaining patches to radio hams for $10, with the profits to go into our account with VOI. If we're lucky, we may make $100 for our next launch. Anyone purchasing a patch who also attends a launch can have their patch loaded onboard a capsule.

For the first launch, I'd like to send the camcorder to 100,000 feet along with the digital camera I just picked up. I'd like to have a mirror in front of the camcorder and the digital mounted to a servo.

I'm working on a cutdown for test. It will use the stopwatch and CC/PS. There will be a third method for singaling, perhaps DTMF. The DTMF will be a part of the back up beacon. I'll also add the audio beacon to the cutdown, and get it 10 feet away from the camcorder and above the chute. That ought to knock down that beep-beep we get on the video tape.

I'd also like to try the pager again, but this time go with a different service provider. The provider must have total Idaho converage.

Paul

How about those satellite pagers? Do they transmit direct from the satellite, or do they just use satellites to connect to a nationwide terrestrial network? Anyway, I think there are paging services that advertise nationwide coverage.

Problem...

My capsule weight is at the six pound limit as is. The addition of a mirror mechanism would put it over the limit. Are we planning on a waiver? We would need two proven cutdown devices and a radar reflector.

I would also like to see the new launch prediction procedures. Have they been worked out yet?

1766. 2 Watt, 56 Gram TV Transmitter

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-19 20:04:04 UTC
From: Tony Barrett
Topic: 1766 Message: 1766

Check out the new 2 watt ATV Transmitter kit (ATV12-440 MK2) at www.northcountryradio.com. The specs say it only weighs 56 grams, though that may be without a case. I'll bet we need some kind of case for shielding. It draws about half an amp at 12 volts.

Their half watt transmitter kit with no audio sells for $62. Another half to one watt kit with audio is $82. Might be kind of nice to be able to hear the audio off the balloon live throughout the flight.

I've built a couple of their kits. Not a bad value. I don't see the 5 watt unit in the catalog anymore, though they still offer a power amplifier rated at 12 watts.

They also sell tiny little video cameras (not kits), some with CCDs pickup / lens units than can be remotely mounted, though these can get a little spendy ($235 for color). See photos at http://www.northcountryradio.com/ppccam.htm. Looks like these only draw a couple hundred mils.

73,

Tony

We only need a wavier if we want to launch more than 12 pounds
without the cutdowns and radar reflector. If we launch with them,
then no wavier is required.

The reflector is easy. I'm working on the cutdown with multiple-
redunant thermal knives. I should have the DTMF decoder together
and tested this weekend. The flight computer and stopwatch will
be two other mechanisms. We just need to find a second way to
send telecommands. Since there will be two seperate radios, I
may just get another DTMF decoder and integrate that into the
flight computer.

> I would also like to see the new launch prediction procedures. Have they
> been worked out yet?

John the Elder wrote a first draft. John, can you share that with the
group? I think we can finish it over email.

The latter I'm afraid. For example:

http://www.baystar.com/range.html

http://www.skytel.com/products/1maps/coverage.cgi?id=MCI&zone=234

I've got an entire ATV setup. It's the 1 watt ATV TX by PC
Electronics. I've also got a mini-wheel antenna and the CCD
camera. The camera is mounted to a robotic arm, so we can have
a look around.

According to EOSS' "Excerpts from U.S. Federal Aviation Regulations (FAR) Part 101 related to unmanned free balloons" web page, at:

http://www.eoss.org/pubs/far_annotated.htm

"A latex balloon which will burst at altitude is considered to be its own independent cutdown device. The second device should be a radio-commandable cutter. Plastic balloons must have a commandable primary cutdown and an independent timer-based backup."

That takes care of one cutdown device. I suggest the second be a combination of a timer and a way to send commands up on the APRS link. I believe you aren't doing anything with receive audio from the transciever in the tracker, so how about adding a DTMF decoder that listens for a specific sequence of tones to trigger the cutdown.

Rick

1772. TVNSP Patches

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-19 22:46:00 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1772 Message: 1772

so far 16 patches have been spoken for. I'll take 10 myself, so I still have to get rid of 3/4 of them. As this is costing me $730 , I'm really interested in getting rid of at least 3/4 of them. If you know someone whou might like one, please let them know.

I believe they'd make a great Christmas, birthday, and wedding gift!!!!

Seriously though, any help would be appreciated. Remember, any patches sold will be sent into near space if the purchaser would like.

Paul

This appears to be an EOSS interpretation. Is that the case? I don't see
that statement written as part of the regulations or I have completely
missed it.

Looks like we need to provide a donation pot with patch displays at all
of our different functions. I will promote at our club meetings.

Might sell better if they have actually been to "Near Space". Expose
some to meteor dust and they might bring double :) Sign me up for 2 more
Paul. (4 total).

1778. suggestions for email list posting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-20 18:48:13 UTC
From: Hank Riley
Topic: 1778 Message: 1778

I guess this could be a voice in the wilderness, or
a blast from the past in the days before web browsers,
but there are a couple of easy things all list posters
can do that make for a better list (any list -- not just
this one):

1. Make your lines shorter than normal email so that
lines will not wrap strangely and break unevenly and
erratically. Following this practice is especially
rewarding when it comes time for someone to quote your
post which sometimes adds these things >. To me there's
nothing worse than seeing totally fragmented email
messages. This is what I mean as a made up example:

Where is the
next TVNSP
meeting
going to be? Is Paul planning on bringing any sample
patches

with him that day?

Keeping your line length short will eliminate that
kind of thing *completely.* Wouldn't that be nice.

2. Renaming the subject line if the subject has changed
substantially. In the case of the "Patches" thread, several
distinct totally unrelated topics have been discussed under
that heading. Jeff did a good thing when he renamed one of
the topics "Cutdown devices."

This practice helps especially the folks who are replying
to posts and want to review a thread, but it makes for
easier reading for everyone.

Mike,

Thanks, very well done picture or scan. If there
is no readily available pure graphic of this design,
I'll try to clean up this image because it would almost
certainly help to sell patches if the logo could be viewed
on the web at TVNSP and/or elsewhere.

According to the web page:

"Prepared and footnoted by Mike Manes, W5VSI, for Edge of Space
Sciences"

I have emailed Mr. Manes asking about his source for this information.
After looking thru their web site, [1] and the projects they are working
with NASA on (Mars Microballoon [2] and GAINS [3]) I have a feeling the
information is correct. I hope to have more details soon.

RW> According to the web page:

RW> "Prepared and footnoted by Mike Manes, W5VSI, for Edge of
RW> Space Sciences"

Okay, nice to get that straight. Too bad instead of hastily scrolling down, I didn't scroll up for the attribution. The small cutdown part I read really sounded like Rick v G., not just because he's the EOSS webmaster.

Trivia factoid: You'll see a reference in the notes to the term "tally-ho." This is a favorite Manes expression and is an absolute dead giveaway to the notes' authorship. (It's military pilot lingo -- I had to ask him once what it was about.) I think it's used by EOSS to mean the first sighting of the about-to-land or already landed payload.

RW> I have a feeling the information is correct. I hope to
RW> have more details soon.

I didn't mean to imply that I doubted the basic accuracy of the FAR notes by EOSS, but just wanted to chime in that they were external to the FAR itself. I guess by "information," Rick, you mean the notes. The strict FAR text is a most recent late 2001 version according to Mike, so that should be fine.

Mike is a former Navy pilot and is very savvy in the area of aviation regs and procedures (he's recently posted on the balloon no-fly zones after 9/11), and is very knowledgeable on just about anything balloon related, period. He's been head of the EOSS tech committee for quite a while, and now serves as EOSS president too.

Paul and I both have known him for years, and Paul recently met many of the EOSS group including, I'm pretty sure, Mike himself.

That FAR with notes is pretty new to the EOSS website. I'm going to be reading it myself since the FAR, as well as many other sections of the CFR, can be somewhat ambiguous and downright contradictory in places (like the FCC regs we know and love).

Hank,

These are good suggestions. How do you normally make
your lines shorter? Do you use the return key instead
of letting it wrap around or does your email program
take care of it for you? I use Netscape Navigator. It
might have some way of limiting the line length but I
don't know how it's done. For this paragraph I used the
return key. I usually let it wrap around because it's
easier to type without having to watch the line length.
Perhaps there's a better email program. At this point if
I go back to add a sentence in the middle of the paragraph
it messes up the line lengths. Suggestions?

Military pilots may have picked it up, but it is MUCH
older...

It was first used by English fox hunters to signify the
sighting of a fox over 400 years ago.

EOSS has worked with the FAA on these issues. FAR 101
appears to be written for poly balloons, not latex ones. The poly
balloons are not designed to burst and terminate their flights like
latex ones are.

Topic: 1789 Message: 1789

This just hit the EOSS mailing list, and I thought the TVNSP people might be interested too...

Ralph, I hope this doesn't count for your time and distance records, it would be hard to beat.

-------- Original Message --------
Subject: [EOSS_LT] NASA balloon at south pole
Date: Tue, 22 Jan 2002 13:46:00 -0800 (PST)

Sorry for the non-EOSSness of this message, but this is too cool to not share:

In a message dated 1/22/02 9:07:52 AM Pacific Standard Time, NASANews@... writes:

Dolores Beasley
Headquarters, Washington Jan. 22, 2002
(Phone: 202/358-1753)

Betty Flowers
Wallops Flight Facility, Wallops Island, Va.
(Phone: 757/824-1584)

RELEASE: 02-13

NASA BALLOON MAKES RECORD-BREAKING FLIGHT

Larger than a football field and flying near the edge of space, a NASA scientific balloon has set a new flight record of almost 32 days after completing two orbits around the South Pole.

The record-breaking balloon carried the Trans-Iron Galactic Element Recorder (Tiger) experiment, designed to search for the origin of cosmic rays, atomic particles that travel through the galaxy at near light-speeds and shower the Earth constantly.

The pilotless, helium-filled scientific balloon was launched from McMurdo Station, Antarctica, at 6:30 a.m. EST on Dec. 20, 2001. The balloon traveled approximately 8,800 miles (about 1,400 kilometers) before landing about 31 days, 20 hours later at 3:03 a.m. EST, Jan. 21, 284 miles (458 kilometers) from the McMurdo Station. Payload recovery operations are in progress.

The previous endurance record for a long-duration balloon flight was set in January 2001 from McMurdo. The flight was one orbit of the South Pole that lasted 26 days. The Tiger mission was able to more than double the amount of continuous
science observational time over any previous balloon mission.

"We are excited with the duration of this flight, which allowed the scientists to get ample science to perform their studies," said Steve Smith, Chief of the Balloon Program Office at NASA Goddard Space Flight Center's Wallops Flight Facility, Wallops Island, Va. "We routinely have long-duration balloons that float for up to two weeks, but to have
one flight last for over 31 days is very rewarding."

Scientific balloons are made of thin polyethylene material, about the same thickness as ordinary sandwich wrap. An enormous balloon was needed to hoist the two-ton Tiger experiment to about 125,000 feet (38,100 meters). The Tiger balloon is taller than the Washington Monument, which stands just over 555 feet high. As the balloon rises, the gas it contains expands. The balloon used for this Antarctic flight expanded to a diameter of more than 424 feet (129 meters) and
weighed 3,687 pounds (1,674 kilograms).

To complete the flight, the experiment and its parachute float to the ground after being separated from the balloon by
radio command. Helium was released from the balloon for its descent near McMurdo station.

"The importance of Tiger is that it is the first experiment that has both sufficient collecting power and adequate resolution to measure abundances of all nuclei from iron through zirconium," said Tiger Principal Investigator Robert Binns, Washington University, St. Louis. "This will enable us
to determine whether the cosmic-ray source is hot or cold, gas or solid. We have already seen in our quick-look analysis
of flight data that Tiger's resolution is sufficient to resolve those nuclei."

Personnel from the National Scientific Balloon Facility, Palestine, Texas, who support approximately 25 NASA balloon flights annually from sites worldwide, conducted the launch, flight and recovery operations of the Tiger balloon mission. Antarctica ground and air operations support was provided by the National Science Foundation's Office of Polar Programs.

Tiger is a collaboration among Washington University; NASA's Goddard Space Flight Center, Greenbelt, Md.; California Institute of Technology, Pasadena; and the University of Minnesota, Minneapolis. The Wallops Flight Facility manages NASA's Scientific Balloon Program for the Office of Space Science, NASA Headquarters.

1794. 2002 Launches

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-21 20:37:35 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1794 Message: 1794

I'd like to schedule the March launch for Saturday the 30th. April's launch would be on the 20th, in support of Astronomy and Space Day.

Any suggestions for May?

June's should be inconjunction with the River Fest. The last day of my rafting trip is on the 19th. I should be home late on the 20th, a Saturday. Can the River Fest flight be on Sunday? If so, I'll be there.

I'll be Kansas for a launch on 6 July. Is anyone planning to be there?

August's flight will attempt to video tape meteors again. The perseid meteor shower is on the 11-12. I suppose we should launch on the night of the 10th, morning of the 11th.

September's flight is scheduled for ISP. That would put the launch on the 7th.

October's flight? Do we want a Novermber flight?

Justin, I'm working with a ham on the Kenwood VC-H1 SSTV. That's about the closest we have to APT. I think we should make one flight carry the SSTV. I'll put you in charge of that. Perhaps the September flight would be good for that. We'll set up a mission control at Bruneau Dunes for this flight. The SSTV will give the civies something neat to see. For this flight we'll also need a tracker at MC. The classroom at Bruneau has a projector, so I recommend we use that to display the map. We'll also need a radio for comms with chase and recovery. I think we'll also be required to give a presentation on Friday and Saturday. Saturday's presentation will be scheduled with the astronomy presentations at ISP.

Twin's ATV flight needs to be scheduled. Any preferences on which launch that should be? We'll launch outside of Twin and get a landing in a much better location.

Other news. I finished the backup beacon. Using Mark Conner's suggestion, I've used a tiny Trak II as the TNC. The back up has it's own GPS, radio, and antenna. It also includes a DTMF decoder to operate the Flight Termination Unit (FTU) mounted at the top of the parachute. The back up is mounted to the parachute ring along with the radar reflector. I still need to mount the aluminized mylar to the reflector.

I guess I should now make sure the CC/PS will work?!

1800. Mall?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-23 01:20:35 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1800 Message: 1800

Would people like to set up a display at the Mall on the last Saturday in Feb? I'd like to set up a collection can and ask for donations for future flights. We could probably sell patches there.

I'll need someone to stop by the business office at the Mall and ask for the paperwork we need to fill out. I don't think they're open on weekends and that they close at 5:00, so I can't get there myself.

Paul

From: Mark Conner
Topic: 1801 Message: 1801

From reading the various lists, it appears we'll have four
launches on February 23rd - NSTAR, EOSS, ANSR, and TVNSP. I
think it would be unusual to have good launch weather in all four
places this time of year.

Plus I have to finish up my payload in order to make the bunch.

Along with GPSL 2002 I'm also planning my summer vacation. In
South Dakota, near Rapid City, is a region called Stratobowl. In
the 1930's they launched high altitude, manned balloons from it.
I'm trying to find it, but so far have come up with nothing. I find web
references, but no maps or directions. Does anyone have a S.D.
map that might show it?

I plan to visit Stratobowl on my way to GPSL 2002.

Sorry, no map, but you can find info on getting directions:

you will want to see the Stratobowl and for that you'll need
directions from us. Info: 605-385-5188

Stratobowl:

http://www.rosyinn.com/5100b01.htm

Directions: It is on private land and not marked on most
maps

Cost: Free

Highlights: The place where the space age was born

Description:

The stratobowl is one of those hidden, almost secret gems of
the Black Hills that few people nowadays visit or even know
about. As a geological feature it is a spectacular place
with 500 foot cliffs on three sides surrounding as small
flat plan no bigger than a few football fields. If you
don't know how to get there, you'll never find it. The best
way to see it is to walk about three-fourths mile back a
closed forest service road to an overlook on the east rim.
This is the spot where the national press corps gathered in
the mid 1930s to watch America's first high-alititude
balloon flights. The altitude records set in these flights
(72,395 feet) stood until the dawn of the space age in the
late 1950s. You can also learn more by visiting the South
Dakota Air and Space Museum at Box Elder, South Dakota.

SD Air & Space Museum

http://www.rosyinn.com/5100a50.htm

Best Time To Go: Open Year Round. Anytime between 8:30 a.m. and 6 p.m. daily from mid-May to mid-September. Winter hours from 8:30 a.m. to 4:30 p.m.

Directions: Follow US16A and US16 east to I-90 then east on I-90 to Exit 66 - Box Elder

Cost: Free, but there is a nominal charge if you want to take a tour of Ellsworth Air Force Base (recommended)

Highlights: Nice collection of WWII birds, and tour of a missile silo

Description:

This is a must-see museum if you are interested in WWII aircraft. On displayare the B29, B25, B26, C47, T-38 and 22 other vintage planes. The museum also has an excellent section of the early Stratobowl high-altitude ballon flights of the 1930s. These flights actually launched the space age. Once you've seen this exhibit you will want to see the Stratobowl and for that you'll need directions from us. Info: 605-385-5188. Write: SDA&S Museum, PO Box 871, Box Elder, SD 57719. For more information about Ellsworth Air Force Base, check out the link below.

1810. Vertex HT/Next Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-25 14:53:36 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1810 Message: 1810

I found out that the HT on the last flight won't transmit. It does receive, however. I have a Vertex HT to replace it, but for the life of me, I can't find the blasted cable that comes with it. Does anyone have a Vertex and the MIC/SPK cable made for it? Can you bring it to the next meeting (this Sunday)? In the interim, I'll search the web for info on making the cable myself.

Bring your capsules and parachutes to the next meeting. I'll bring a BS-2 with programming board and some LEDs and resistors.
The goal will be to write a program to blink LEDs and download it.

The backup beacon works well. I used a Tiny Trak II, Etrex, and DJ-S11, and soft wire dipole. It sends posits that includes; lat, long, alt, speed, and heading.

The new CCPS is controlling servos and allows communications with the BS-2p and MIM. The MIM transmits. However, I didn't get the BS2p to send telemetry to the MIM. I'll troubleshoot that this week.

1815. RE: [tvnsp] Thermochron

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-25 18:10:14 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1808 Message: 1815

so i thought I'd pipe up.
I've almost done with a basic stamp 2 device that simply toggles a analog mux to get analog thermometer (simple transistor thermometer proven linear in chamber, this was the graph i sent out a few weeks ago) data through a single A/D converter and then into the basic stamp, and out a serial port. The idea here, is to create a text file with the temp data, thus eliminating the need for the
thermal chip that records thermal measurements to be downloaded later...

So maybe we'll run both together? It would be interesting to compare the data..... it would definitely show
us which thermorcrons were bad (remember hearing something about that).

I have a few more hours of work to do on my basic stamp board...
specifically getting the mux wired up,
and figuring out how (I'm new to the stamp) to store digital input (1 or 0) from 8 pins into some variable to retransmit out the serial port..... It would be great if folks could help me out there, I'm a little pushed for time before Sunday afternoon... anybody written stuff like this before? I'm using the BasicStamp2SX specifically.

The only documentation I've found free online is for a pic version of basic stamp, and it's not from parallax themselves.... if someone has a pbasic grammar / coding guide of some kind they could email or point me to the web that would be very helpful.

1817. Balloon temperature measurements at SkyQuest, part 1

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-01-27 03:40:04 UTC
From: Hank Riley
Topic: 1817 Message: 1817

This is part 1 of a short discussion of electronic temperature measurement for balloons.

Before going any further, I'd like to establish that what I've done with balloons is only with payloads that are discarded; none of the seven or so launched have been recovered. This *heavily* affects the design philosophy, because payloads must be cheap, and that means simple and light. Very simple, very light. A whole new payload has to be built for each launch!

SkyQuest currently holds the record for the smallest balloon envelope used to lift a telemetered payload, and the second place for the lightest payload.

There are essentially two ways to electronically measure temperature practically on a balloon:

1. PN semiconductor junction temperature dependency devices.

2. thermistors

A diode, the little IC temp. sensors by National and others, and the 1-wire digital temp. sensors from Dallas all are type 1 devices.

SkyQuest so far has employed thermistors because they are the very least expensive, even less so than a diode taking into account a diode needs some amplification to do decent measurements in a balloon.

The thermistor's main disadvantage is its inherently nonlinear resistance vs. temperature response, but such nonlinearity can be dealt with on the ground.

So, the thermistor is simply hooked up between a resistor and a stable reference voltage, the combination serving as a voltage divider which feeds directly into a microcontroller A/D input.

The microcontroller is always an OTP Microchip microcontroller having at least 4 separate A/D channels (all A/D PICs have at least 4 channels, some even more). OTP means "one-time programmable" so once the program is installed on the chip, it's there for eternity. When we began SkyQuest, there were no flash PICs available with the A/D feature, and external A/Ds add to cost and detract from the ultra simplicity for which we strive.

Is wonderful to use a BASIC STAMP or equivalent for a balloon, but the OTP PICs with four built-in A/Ds cost under $5! They also use

far less power than the new fast BASIC STAMPS.

Next message will have weblinks to pictures and graphs from SkyQuest.

Hank

Paul
I found a place called "Stratosphere Bowl" on the Street Atlas map.
It shows it NE of a small town called Rockerville just SW of Rapid City.
I will have my laptop at workshop Sunday if you want to look at the map.

I saw them at NSBF last summer. They use two sets of jaws that
are interlocked togther. A steel cable ties thems together. They
pass the cable through a line cutter that uses an explosive to drive
a piston through the cable severing it. Once the cable is cut, the
jaws seperate letting the balloon and parachute fall a part.

The jaws are machined from big hunks of aluminum. I imagine the
jaws, steel cable, and line cutter weighs as much as our capsules.

1838. GPSL 2002 Announcement

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-01 21:56:27 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 481 Message: 1838

I'm attaching the official announcement of the Great Plains Super Launch 2002 to this email message. It's a Word 2000 document. Please pass it on to any other interested parties.

Note that you'll have to register for GPSL 2002 so I can get a head count. I'll be making reservations for lunch and dinner along with printing up a proceedings. I'll need the head count for these. the only cost other than meals is for the proceedings. Those cost $10. when you register you'll also need to let me know if you have something to display (poster, flight article, etc). I'll make arrangements for tables for displays.

I will arrange for helium at the launch site. So in the announcement I've asked for a count of tanks needed. These tanks cost $45 each if we order at least six. They should be T tanks, but Linweld says each tank holds 240 cubic feet of helium.

If anyone will be int he Manhattan area on July 2 and 3, please let me know. I'll need help carrying the helium tanks.

If anyonw would like to volunteer to help out, please let me know. I have a PA officer, but could use help getting the word out to other organizations. QST has been notified. Can someone volunteer to make a video? I think I'll need a "gofer" to take care of odds and ends during the symposium. I could also use a photographer. I plan for a group photo at the beginning of the symposium and at the launch site.

Bill All is begining to arrange for a special events station, he could probably use some help there. We will set up a mission control at the launch site for those who want to help launch but not chase.

If there's an interest, I'll arrange for a GPSL 2002 t-shirt. The cost will be somewhere around $10 each. Email me so I can get a head count and I'll also need to know the size required.

Paul
To near space and beyond!

1840. Thermal analysis of space blanket layers and hand warmers.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-04 15:52:31 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1840 Message: 1840
Attachments: 4 described; binary payloads are missing from this source WARC

About the thermal analysis.
The short story: The various numbers of layers of space blanket rap have no effect on cooling
by convection. I imagine they would be effective against solar radiation, if you wanted
to prevent overheating, but over-heating does not appear to be a concern of ours.

The long story:
I ran Craft4 and 1 first (1=1 layer of space blanket,2=2 layers...etc).
For crafts with 2 or more layers of space blanket, these layers were separated
by the wedding veil stuff.
If you look at the spreadsheet "NEAR-THERMAL craft4and1.xls"
you can see that the 3 extra layers on craft4 had little impact.
In fact, the data shows the craft with 4 layers was actually a degree or two cooler
throughout the experiment, i attribute this to experimental error, and would suggest the two crafts exhibited nearly identical thermal properties.

For the second experiment, i used craft 2 and 3 (2 and 3 layers of space blanket)
and threw in a hand warmer into each craft.
I used the 2 and 3 layer crafts, and sealed them carefully with tape when I put the lids on,
because i wanted something airtight.. to simulate the oxygen poor situation at high altitude.
I took the two hand warmers out at the same second... let them sit at 25C for a few
minutes, shook them aggressively for 45 seconds, let them sit again for a few minutes,
sealed the crafts at the same moment... and then ran the same experiment as above on
craft 4 and 1. The had warmers did a good job.... check out the plots....
Again, craft2 and 3 behaved nearly identically with respect to the layers of space blanket.
Recommendation: Hand warmer was very successful in maintaining craft temp of approximately 25-35
Celsius above environmental temperature, and also slowing convective cooling greatly.

for both experiments, the crafts were left in a 25C environment for several days with the lids off
to allow the materials to settle at 25C. In the chamber the crafts were placed on folded paperclips to

keep them from coming in direct contact with the bottom surface of the chamber, and everything was spaced
as evenly as possible to allow for the greatest airflow between crafts/floor/walls etc. There was a fan in
the chamber insuring good mixing, it always ran. Also, the temperature acquisition system was calibrated from -60 to 40 C moments before the experiment.

An explanation of the plots for both experiments:
The black data points with the numbers (near the top) - is the time in minutes from the start of the experiment.
The orange and green lines are the trend lines of the temperatures of chamber 1 and 4 respectively
The dark blue curve near the bottom is the chamber temperature throughout the experiment.
That big blob of purple that runs left to right near the top is a reference temp, taken outside the chamber, to prove everything is stable throughout the experiment... (and also infers accuracy of +/- 2C). This "reference" probe was located on the circuit board.

I will attach a couple of smaller images to this email, I have about 10 total...
if you would like them, just drop me an email, i hate to irritate folks with modems ;)

I REALLY enjoyed doing this thermal experiment.... I'd be happy to test more stuff for
this club or other clubs!!!! Any other thermal experiments needed? I would suggest trying different thicknesses of craft walls... you know, a different "R" value... lets try one and two sizes thinner.... (ultralightweight craft just strong enough to survive landing...)
The only limitation is that the chamber is 16x11x12.

Dave

So it appears radiation is not the primary cooling method in the chamber. As the pressure drops it should be, but our last flight showed that it was not significant. During spring break I'm going to Weber State. They have a microsatellite program. I'll bring this up with them.

Paul

Nice work David

If the blankets and scrim are of little significant use for internal heat retention,it will speed up capsule building and hold down cost. That stuff is a pain to work with,even though it looks "cool" when done. "KISS" in effect again.

I would like to build some mini-capsules out of my 1/2 foam,for you to test. I thought i was purchasing the standard 3/4 inch foam :(

What were the inside dimensions of your test boxes? I also have 1/4 foam-board liner inserts to strengthen my capsule. Would like to see if they have any effect on thermal convection.

I actually think a single rap of the stuff is good, because
it is one more wind proofing measure, having air rush through
the craft is a bad thing :)

The inside diameter... I have them in the truck at the moment.
I'm not sure. Paul - Do you remember? I'll grab a measurement
by tomorrow....if we don't hear from someone who knows.

okay this is going to be random.

Randy, I was backpacking in Denali (Alaska range) alone,
and using only a handheld calculator(HP48) and a TNC and
small HT to communicate with the MIR packet mailbox...
I was so far to the north, that stations in the US were
not in the footprint of the satellite at the same time as
me... so I had to upload messages to the packet mail box
as fast as i could (only had 45 seconds of usable time).
Then other hams would email my wife my status...

but there was ONE guy who i saw beacons from... I thought
it was N7GPS.. but it may have been N6GPS, I never was able
to get a hold of that guy, was it you?

The images are small, I'll throw 3 in.

1846. backpacking, and packet through MIR

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-05 20:28:23 UTC
From: Hank Riley
Topic: 1843 Message: 1846

David,

Love the Denali tent picture. Unfortunately most of my backpack pictures are slides, so it's not as easy to get them on the web or in email.

I have some graphs and commentary to share with the list that is the result of Jeff's home freezer mylar tests that were performed in December, but weren't graphed until last week.

Before I get the details on, the bottom line is that no difference was discerned between with and without mylar.

Hank

GOOD Point,I agree. Besides, it would break Paul's heart if
he did not have a good use for the "Cool, Simulated Gold
NASA Mylar" ;)

David

(reply to previous reply minus jpeg's for brevity)

I don't recall seeing you in Alaska. Since we have so much activity on our APRS network,it is easy to overlook someone. It was probably K7GPS (David Dobbins) in Pell Ell (sp?) Wash., near Seattle. Dave is the NW APRS leader of our informal APRS group. Very nice guy,so drop him a line. There are at least 5 "gps" ham call suffixes around the country that i know of now ;)

I did message a climber on top of Mt. Borah last summer,but i recall he had a kenwood THD-7. Now with the new Packet Sats.and TCP/IP,it is pretty easy to get a message from any where in the world. I even had people messaging me all the time while hunting last fall. Maybe that is why i had no luck hunting deer,those doggon beeps kept going off at the most inappropriate time :) BTW, i use a KW THD-7 with a Garmin III+ on my 4 wheeler and when on foot hiking. Smallest package i can up with so far off the shelf.

Liked the pictures anyway.

I went to the board meeting of the astronomy club last night, which happens to be a few blocks away from the VOI board meeting.

I am scheduled to give a presentation to the astronomy club this Friday. Would anyone like to attend or help out? The astronomy club is looking forward to TVNSP doing a launch during the Idaho Star Party (second Saturday in Sept). I'll finalize details with Bruneau Dunes.

I'm going to look into having bumper stickers made. Is anyone interested in buying some?

Don't forget, we have a meeting this Sunday and a table at the Mall on the last Saturday. Please buy patches. If you think you know someone who will buy patches, pick some up at the meeting.

Paul

1856. NSTAR power budget

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-07 05:34:38 UTC
From: Mark Conner
Topic: 1856 Message: 1856

Here's the power consumption on the various devices in the
current NSTAR main capsule:

Controller (BS2p, two LEDs, other circuitry on the CC/PS board)
60 mA
TNC (KPC-3 v6.0) 30 mA
Radio (Alinco DJ-190) 100 mA receive 700 mA TX at 800mW with a
5% duty cycle [135 mA average equivalent]
GPS (Garmin GPS-35LVS) 130 mA

Total - 355 mA

With the 4000 mA battery, the capsule should theoretically run
for about 11 hours. Nine hours is more realistic given that you
can't get all the energy out of the bottom of the battery's
capacity. I'll have it running overnight tonight to see how it
comes out.

I need to come up with equivalent figures for the Yaesu VX-1R. I
think the receiver on it takes about 50 mA, so I could get some
more battery life there.

The main capsule is now assembled into its flight configuration.
I have the radio mounted horizontally in the capsule near the
top, then a right-angle BNC and the antenna attached to it poking
out a hole in the top. This should hopefully be efficient enough
to get out, yet short enough not to cross two power lines.

I'm at HP today, and have the NEAR crafts at my desk.
I'm leaving town tonight to see my wife for a 3 day weekend.
Is there someone at HP I can give these crafts to?
I guess there is another round of testing to be done to
these chambers. I'm stuck here, my car is in the shop,
so I cant deliver them offsite.

> Ok, Paul......remind me what the topics for the ATV Quarterly were.....I'm
> on a roll writing for the VOI newsletter, keep me going!

Ummm, I should try guilt more often!

Thanks Mike. This goes to everyone else also. I gave ATVQ a
modified copy of the article for the Space 2002 conference I wrote.
It's just a basic outline of what amateur near space exploration is,
it's costs, and some data collected on past flights.

Gene Harlan would like to see a series of articles on how to create
a program. So we need to write about construction of the various
parts, assmebling them into a stack, proceedures for filling
balloons, tools required, APRS settings, predictions, chase, and
how to generally have a good time getting up at 4:00 aM on a
Saturday.

So please, everyone, pick a topic that interests you and begin
writing. Briong your work to the TVNSP meetings and everyone
will help you out.

Paul

I'll be showing some videos along with the slides. How about if we
alternate on the slide show? I'll do one, then you do the next, etc.
The talk is focused on what is near space and how we ge there.
So on the predictions part, keep it at a level that explains what we
do, don't go into really deep detail.

> Also, if you will be home before going to the astronomy meeting tonight,
> could you bring some patches, and some Dacron strips for making the ring
> tabs?

I won't be going home, but I did bring patches (I hope to make a
few sales). I tossed my dacron into a parts box, so I'll remember
to bring it on Sunday.

I plan to be at DCI by 7:00, or 30 minutes early. Can you get there
that early? I'd like to run through a quick practice. The meeting is
held in the back of DCI. As you look at the front door, make a trun
to the left and walk around to the side entrance. It's all the way
back, near the back end of the building.

Can anyone else make the meeting? I'd like to give everyone a
chance to speak.

By the way, we have 30 to 45 minutes to talk. There will be a
presentation before us on the Astronomical League.

Paul

1867. Vinyl Stickers

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-08 17:21:59 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1867 Message: 1867

I looked into purchasing vinyl stickers, or bumper stickers. We can order 500 of them, in two colors (three if you count the color of the vinyl) for $375. That comes out to 75 cents per decal. The are 3.5 inches in diameter and durable.

Is anyone interested in getting TVNSP bumper stickers? I can't afford $375 now, but could after the cloth patches are sold.

If we order them, it takes about 4 weeks before we get them back.

Ideas? Inputs?

Paul?

1868. RE: [tvnsp] Friday's presentation

If you made a generic "high-altitude ballooning" sticker, more of us down in Kansas may be interested.

The presentation went well. It was a bit longer than I thought it would be, but no one was trying to leave.

We need more speaking opportunities. We didn't sell any patches, but did sell 2 t-shirts. That's $10 for the balloon fund. I'll bring it to the VOI meeting Wednesday. Mike, how'd we do at the board meeting?

Paul

From: verhap@occ1.sd01.k12.id.us
Topic: 1877 Message: 1877

Interest has been expressed for a generic ballooning bumper sticker. For some reason people outside of Idaho don't find a TVNSP bumper sticker as appealling (go figure).

Please send suggestions for a design. Originally, I was going to have a 3.3" vinyl sticker made in three colors (two inks and the white background of the sticker). The design was the TVNSP logo.

I'd be happy to develop a more "universal" design, but would like some input. The TVNSP design incorporates a balloon, a curved horizon, Idaho, and some stars. It also has the name of the program written around the edge.

I figure the new design must have a balloon and payload (that will be in white). I think we should have black skies and a horizon. But this may get us too close to the EOSS emblem. Variations?

What about the wording? I think the word amateur should be in it. What about Near Space? Do we incorporate Amateur Radio into the text? I figure the text will be in black.

If I order 500 of these, the cost will be 75 cents per sticker. If I order 1000 of them, the price is even less.

For the same price, the sticker can be 3 by 4 inches, so the design it doesn't have to be round.

If I order 1000 of these, can I get committments from other groups to buy at least 100 of them up front? I don't want to have lots of my money tied up in trying to sell a thousand stickers.

How about a balloon over the USA with a few stars in a curved row at the 2 o'clock position? At the 8 o'clock position would be Amateur Near Space, also in a curved row? The design is for a round patch.

By the way, we can also get a larger diameter patch. I'll get some prices and email them.

Hey Paul,

Did you know there is bumper sticker paper designed specifically to be fed through a laser printer? The Women's Challenge makes bumper stickers out of this material all the time. They just buy the blank vinyl stock on a carrier sheet in various colors (white, yellow, orange) and print what they need on demand. That way they only have to stock the blank media and they never have to worry about getting stuck with stickers that don't sell. And with color laser printers not all that uncommon ... These bumper stickers are extremely durable. I know they ordered the black stock from some place here in town. I could check into it if you like.

You could buy some blank stock, make up some designs, copy the files onto a CD or floppy, and take them down to Kinkos for color laser printing and still get a good price if you print three to five per sheet.

I work testing commercial color printing presses everyday. Maybe we could print the bumper stickers while testing other things.

Anyway, you might want to check out some other options before spending hundreds of dollars on 1000 identical stickers. I'll bet we can do better than 50 cents per sticker and only have to spend $50 on a box of blank laser printer stock.

CUL,

Tony

From: verhap@occ1.sd01.k12.id.us
Topic: 1879 Message: 1879

I've ordered some kite string and fiberglass rods. The string is for shroud lines and the rods are for the radar reflector. At the last meeting, John and I started building the radar reflector out of 1/2" foam. I think we can make a lighter one from a fiberglass rod frame and taping the space blanket to the rods. This leaves the blanket vunerable to tears and puched holes if something pokes through it durning landing. A mini capsule will house the cutdown reciever and audio beacon. The capsule will be mounted to the top of the reflector.

Paul,

It's your money, but it seems with the patches and tee
shirts not exactly flying off the shelves it might be
prudent to hold up on another multi-hundred dollar
expenditure on these enjoyable but limited demand
souvenir items.

Tony's laser printer method sounds promising.

By the way, now that the patch company has digitized the
logo design, could you please upload that image sometime
to the TVNSP file area?

I still have Mike's image of the tee-shirt logo.

Hank

Paul, Tony.....
International Paper also makes vinyl bumper sticker stock under the invent it!" logo that is for use specifically with inkjet printers (in fact, it says 'do not use with laser printers or copy machines' right on the back of the package) and can be found at Walmart. I have had good experience with the durability and the print seems to last a good long while. I don't remember the cost, however, but just thought I'd throw out another option.

Tim,

I thought about inkjet, but with the ink being water based, how does it handle the exposure to water its likely to get sitting on a car bumper?

If it works it sounds like a good idea. Do you overcoat it with something like a clear lacquer spray or a clear vinyl sheet?

Tony

They didn't digitize it like I asked. They scanned it off the t-shirt I brought them.

I'll see if someone can create the logo from scratch.

I found out recently that Kaymont makes a series of balloons that are designed for severe weather observations. Supposedly they're tougher than the regular ones. They come in 800g and 1000g weights, maybe more. They're designated as KCI-800N and KCI-1000N. Not sure of the performance comparison. Cost is about the same. They have the "NWS standard" neck size, which is larger than the usual Kaymonts.

I'll be using one of them for the NSTAR launch at the Central Plains Severe Weather Symposium, courtesy of the NWS Omaha/Valley office and will report on how they work after that.

Are they sure to burst? Is there a chance they'd become neutrally
bouyant?

[snip]

Mark,

You want to be careful with these. Ironically, if these are
made with a thicker envelope, which I think they are, an 800
gram "tough" balloon may actually burst at a *lower* altitude
than a regular (thin envelope) balloon.

I can discuss with you off list about how that works as far
as the several variables involved in burst height.

Part of it is that a heavier balloon skin will result
in a smaller uninflated size, which in turn heavily
influences how much it can expand before reaching the
burst point.

One may ask what the point of a heavier skin balloon is
if it bursts at a lower height. The answer is that before
it bursts it can stand more thrashing about in the
atmosphere.

The thing is, with amateur balloon launches, we don't
launch in *bad weather* anyway on the ground. I'd
generally recommend not using these balloons in general
on amateur launches since the regular skin thickness has been
found to be adequate.

Hank

Given that NWS is unlikely to want neutrally-buoyant radiosondes floating about, I would assume their probability of bursting is about like the regular latex balloons. But I'll drop Kaymont a note and ask.

I first thought it might not be too interesting, and it's
speculative on my part not having the Kaymont specs.

When I got an email from Mark last night it seemed
what Mark said was definitely of general list interest,
so here it is:

MC> I'm not too concerned about a lower-altitude burst, and since
MC> the symposium has made this launch such a feature, I'd rather
MC> use something that can take some stress and abuse while on the
MC> ground should it be windy that day.

MC> Plus, it's a free balloon from NWS (and free helium, too).

That's all great when the stuff is free!

MC> I figured it would be a lower burst altitude, but NWS says
MC> they get 28,000 meters (91,000 ft) with their 800g balloons
MC> and a radiosonde payload. This compares to about 32,000m for
MC> a standard 800g balloon.

Okay, that's the effect I thought would be apparent, but it's
not a huge difference (but still over 12,000 feet). Just wanted
to point out that the max. altitude might be compromised.

I'd like to get the uninflated and burst dimensions on those
tough models from Kaymont, but the only special balloons listed
on its website are the cold weather ones (different latex
formulation).

Hey Paul,
For a BSU class project I'm going to build a NEAR craft controller (BS2 based, DTMF controllable, data collection, transmitting via AX25, cut down device...).
Can I get that PowerPoint presentation you made? I'll probably have to hack it down to 2 minutes, but at least they would have a clue what a NEAR craft looks like, and the basic motivation for building this thing...

Thanks
Dave

Hey Paul,
I seem to remember you have a chip setup to do AX25 AFSK
modulation...
then you just feed the audio output of that to a radio.... I would like to
play with modem chips as well... Thus, the basic stamp could compile all
data
and send it to the modem chip..... otherwise I could use a normal TNC in
transparent
mode I suppose.....

I use the MIM Module. It has a PIC that accepts text data,
packetizes it, figures the CRCs and then opens the radio and
generates the audio tones. I bought mine from the APRS website.

that's a tall order...
building packets.... I would have allot to learn about AX25.. that seems
like the hard part.
checksums would be easy...
serial sending would be easy...

I wonder if its patented? If i build it, what are the chances I would NOT
be able
to freely distribute it?

Paul,

Isn't one of the drawbacks of the MIM that it actually
doesn't accept all text data, and that you have to trick
it into sending some of the text that you've been
successful so far in doing? That text being generated
by the BS2.

The expense of the MIM, and the inflexibility of the MIM
and Tinytrak are the reasons why I'm designing a balloon
packet assembler, and there may be others on list doing
same. It would have no restrictions on text format that
it would packetize.

Hank,
Do you have a webpage for this project? I'd like to see what your choice of solution is and where it's at...
Is it Pic based?
Thanks.

1906. balloon transparent packet assembler

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-13 19:10:57 UTC
From: Hank Riley
Topic: 1899 Message: 1906

> I wonder if its patented? If i build it, what are the chances I
> would NOT be able to freely distribute it?

David,

No problem since there are several send only TNCs around
already. The problem that prevents their application in this
circumstance is that all of them place restrictions on what
text is accepted to be packetized.

> to freely distribute it?

SSOK used their own TNC designed from a PIC, as does the Tiny
Trak. Making one yourself without looking at someone else's code
should be fine.

A modem chip connected to a PIC should do the trick.

The MIM accepts text with the prefix you program into it. I fool it
into accepting everything and have the Stamp control what it hears.
This is one reson I'd like to design my own TNC. I feel I could
design a better specification for balloons.

David,

Before I mention my progress on this, I'd like to
direct you to over a dozen message thread on this
subject that started with a post by Mark Conner
December 7, 2001!

TVNSP at Yahoogroups message 1558 of 1907

From: "Mark Conner" <mconner1@h...>
Date: Fri Dec 7, 2001 2:57 pm
Subject: "Son of TinyTrak" as possible MIM/TNC replacement

In that thread, which changes title at least once (to "comm
controller"), devices already built and tested by Michael
Gray and Zack Clobes (both balloons) are discussed.

I have designed, built, and flown a small beacon that sends
GPS NMEA as well as a plain text status message using
a PIC controller and stanard MODEM chip. Complete source code
schematics, and board layouts are on my web page. Even if you
don't use the exact stuffshown, it might give you ideas
for your own design.

http://www.kd7lmo.net/beacon.html

Good luck on your future launches...

I just got a notice back from QST last week that they rejected my article so I'm just going to post it on my website. It's got full construction details including development cycle, theory of op, construction, art-work, code, and some troubleshooting. We've flow this basic design on two launches now without any major problems. This particular revision is scheduled to go up 9 March.

Zack, sorry to hear that, though not surprised having
spoken to Steve Ford about what QST is looking for. Did
QST happen to invite you submit it to QEX, or was that
automatically done by default with QST not interested?

> It's got full

Topic: 1899 Message: 1914

>Yep, sucks, doesn't it.
>The Tiny Trak II is cheaper, but only sends posits. Would you be
>interested in designing a cheaper TNC for flight computers?
There are already a couple options out there. Personally, I lean toward leveraging one of the balloon specific efforts that have already been mentioned.

However, for the sake of completeness...

TAPR's PIC-E seems to be cheaper than the MIM module. (though now I can't remember if the non-member price was cheaper or not.)

There is also a kit TNC on the market that goes for about $60 as I recall. Tony Barrett has one so he is probably better suited to comment on it. It is KISS mode only, but does have tracker capability without a computer attached.

Tony - Can it be used as a tracker with a device attached?

Bill

p.s. Looks like Micron may be filtering Boise schools again since I didn't get Paul's message.

In short, they said it was too long but had potential. I've got too much time wrapped up in it now for potential, plus a number of people have expressed interest in getting details. I'm not sure about the QEX - I considered it but they never brought it up.

From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1918 Message: 1918

I got one of these a few years back, the guy has 2 left (with manuals, not in box, no cables)
for $75 + $7 for shipping.

Three years ago i paid 95..

http://www.radiodan.com/ted_stuff/AR-210.htm

They are VERY lightweight and compact.
I used it for that backpacking mir/alaska thing.

By the way I looked up that call sign, it was N6GPS.

I think the KISS TNC kit I built only cost me $60. It has two modes; APRS Tracker mode and KISS TNC mode. It has only 4 ICs: a preprogrammed uP, additional memory, a serial chip, and a modem chip. I read an article by the kit's creator in QST some months ago and built one. Works like a dream. Don't know if it has all the capabilities you need, but it may, and the price is right.

Bill,

"Can it be used as a tracker with a device attached?"

Device? Not sure I understand the question. It only has the one serial port. You connect either a GPS or an alternative serial data generator. It does, however, send and receive packet data when in KISS (not tracker) mode.

If you explain further I'l try to give a more complete answer.

Tony

And the kits creator was really great about quickly answering questions via e-mail, AND he even sent me a free upgrade. I was so surprised. It just showed up in my mail one day. Now that's SUPPORT with a capital "S". I don't know what his business is, but he's just doing this as a ham. He can't be making much on it. He might even entertain designing a custom unit or assisting or modifying what he's got. I've seen his name associated with other TNC projects. It John Hansen, W2FS.

1922. MIM and DTMF

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-15 16:29:38 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1922 Message: 1922

One of my early flight computer projects used a California Micro
DTMF decoders. It's the CM8880. Scott Edwards had an article
on it in Nuts and Volts. This was a couple years ago.

The same board used a MIM built from parts. I had to buy the
programmed PIC, but it was inexpensive.

I soldered the baord together and started some tests. It's still
around if anyone would like to try it out. I didn't go any further with
the project because it has such a high parts count.

Here's the website for another balloon group. I don't know sucessful they are compared to our simple flights, but you may find their program interesting.

I'd like to attempt a rocket launch from near space, like they're trying.

cheap TNC if anyone's interested...
this guy took a while to get back to me,
I went ahead and bought the AOR-210 for $75 new.
I already have one, and love it, small, light weight.

1929. APRS+SA Setup!

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-19 05:14:30 UTC
From: Mike Garske
Topic: 1929 Message: 1929

Hello All!

I need some help setting up my TNC to talk to APRS+SA. I am pretty sure I have the cable between the Radio and TNC properly wired.....the radio is a Yaesu FT-7100M with the 6-pin mini-Din. And the TNC is the KPC-3+ Firmware 8.3.

So far I can receive and transmit using the Pacterm program the TNC came with, but running APRS+SA is another story! I can see my GPS string updating, and it shows me on the map, but I don't see anyone else, or anything on the Terminal screen of APRS+SA. I can't figure out what I am doing wrong......

Any help would be greatly appreciated!

Mike KC7DPD

If you can do this much your cable should be correct.

>but running APRS+SA is another story!

I think pacterm puts the TNC in host mode. You don't want to be in host mode. You want to be in term mode. Not 100% sure but I think there is a command in pacterm to go to terminal mode.

Make sure you're in terminal mode and that the baud rates match and you should be fine. (Personally I set anything having to do with APRS to 4800bps. It saves headaches.)

Bill

p.s. I think the above is the most likely, but you might also check that you haven't checked the KISS mode box in setup.

1931. Re: [tvnsp] APRS+SA Setup!

Topic: 1929 Message: 1931

Thanks Bill! Looks like I was shooting myself in the foot....I would bring up pacterm, testing the TNC, then bring up APRS+SA, and get nothing! Got a tad frustrated....to say the least! But it is working, and updating the map correctly. Now just to tweak the mapping a tad and learn the program well and I am ready to track some helium filled apparatuses!!

P.S. Look for me on APRS!

1932. Weather Balloons gone commercial

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-19 14:27:19 UTC
From: Doug Rich
Topic: 1932 Message: 1932

I just read an article from infoworld that shows a wireless repeater attached to the neck of a weather balloon being deployed by the National Weather Service.
They plan to have 69 repeaters in place at the same time as the service launches every 12 hours.
It looks like they could benefit from floater type balloons and we could become part of a commercial enterprise. What do you think?

From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1933 Message: 1933

Okay, newbie question here.....

A few weeks back at the meeting at hobby town, there
was some discussion about the power supply having current
limitation issues when activating the cut down device.

Specifically the issue was that the Nichrome solution
required more current than the power supply could deliver,
and therefore, was not getting hot enough....

so my "bucket head" question is : "why not use a smaller
diameter of Nichrome?"

http://www.wiretron.com/nicrdat.html

This webpage indicates "(Note: For *Coiled* elements divide *straight*
wire amps by 2 for approximation purposes. "

What have people found to be a good temperature to shoot for when
utilizing Nichrome? It seems like 500C would be enough....

So the practical solution (to the untrained eye) would be to just
select a smaller diameter piece of Nichrome, and coil it (with the
load line in the center of the coil....) and then hit it with whatever
power supply you have available.

We'd need to perfect the cutdowns for floater balloons. What I
have works with latex. To be commerical means we'd have to
move off the ham bands and onto business bands. Is there a
licensing proceedure for business band?

Subject: Re: Nichrome

We have a Nichrome sampler engineering pack:
We can include each of the awg sizes you asked for except we would have to subst. 33 awg or 35 awg for the 34 which is not in stock. You would get 3 ft of each.
Cost: $ 65

We take all major credit cards.

I bought mine mail order. I think it was from Mouser Electronics. I
have a 10 foot spool of wire, so I have plenty to share. Does
someone want to purchase a 10 foot roll of 33 gauge? I've got
some 30 gauge to trade.

1939. RE: [tvnsp] FW: samples

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-19 22:03:35 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1937 Message: 1939

If we all went in on a 10 foot role together, that
would work out well I think... I need a foot for my class
project.

So you think the 33 would work? assuming we could deliver
1/2 amp we'd get 538C. I don't know the flash point of load
line off the top of my head.

Will 4 AA batteries in series provide 1/2 amp for 10 seconds?

Mouser online and the print catalog do not seem to list
nichrome wire in any form. It's not that common an item
with electronics distibutors.

Paul, I wondered where you got yours. Mike Manes of EOSS
buys junky hair dryers at flea markets and pulls them apart
just for the wire.

Hank

The engineering sampler pricing is NUTS! This following offer
is from a busted link I found at google. It's quoted here just
to establish a realistic small quantity pricing reference point.

I have another earlier post but it's not getting through by
email, so I'm using the egroups website now.

Hank

Let us send you a free gift of 10 feet of 36 gauge NiChrome
60 wire (a $2 value). It works great for "electric matches",
pyrogenic igniters and DIY foam-cutters. Just enter your
information below and we'll mail it to you...

Actually the cost is all labor. Its just as much work pulling all the
spools out off the pallet racks and then individually cutting, labeling, and
packaging the samples for 1 foot as it is for 3 ft. Hope you understand.
We all have to make a living. Surely HP can afford $65?

From: Hank Riley
Topic: 1937 Message: 1943

> Hope you understand. We all have to make a living.

Looks like there's room for a subcontractor like me
to make money for this outfit by buying model rocket
nichrome and reselling to this place, thus relieving
it of this onerous labor burden it's bearing. :)

> Surely HP can afford $65?

Yeah, but it's too smart to. For $65 I'd like an
azure velvet-lined phillipine mahogany case for
the samples, and make the hinges and clasp gold
plate, please.

Hank

David,

To some degree its a matter of thermal mass. The wire won't get to 500 C if the line acts as too much of a heatsink. And the battery voltage may sag to almost nothing if the load is too big. No volts, no current, no heat. You might find some combination that works, but just using smaller wire is not necessarily a solution. You want to get the line hot, not just the wire.

Why melt something when you can cut it? I would still like to see some kind of a mouse trap device that has lots of energy stored in it on the ground, then, using a very low powered release mechanism, release the stored energy. Even a wind up motor could saw through the line. And then there are flashbulbs that get really hot if you whack the end with a good stiff spring.

Not to be too negative here, but my tests indicate that you won't get 1/2
amp from 4 AAs in series for more than a few milliseconds - if that!

You can buy foam cutter wire at Hobby Town USA for a couple of bucks!

At 11:08 PM 2/19/02 +0000, you wrote:

From: Hank Riley
Topic: 1937 Message: 1948

Okay, 10 cents a foot so far.

Aerocon Systems may want to license Wiretronic its technology
for handling the nichrome wire nuisance so well that it can sell
nichrome wire for less than 1/25th the price of Wiretronic! :)

I'm trying to locate the webpage for the Arizona model rocket
place. Its free wire offer is still in effect, but it may take
3 months for it to come through (only 4 shipments a year for this
freebie).

Hank

A Model Rocket Outfit in Arizona

Resistance Wire

Nichrome Wire - 36 gauge
36 gauge. NiChrome-60 alloy. Perfect for electrical ignition
of rocket motors and for "electric matches"
To order: ft @ $.20 per foot

Nichrome Wire - 27 gauge
27 gauge. NiChrome-60 Alloy. Heavy-gauge resistance wire perfect
for heavy-duty foam/plastic cutting, DIY electrical furnaces,
DIY power resistors, etc.

Caution: Don't use this stuff for small igniters...use the 36
gauge for this purpose
To order: ft @ $.35 per foot
---

www.aeroconsystems.com/electronics/nichrome.htm

Nichrome Wire

This high quality new stock 34 gauge nichrome wire is perfect for
making your own electric matches.

50 feet for $6.00

The cost really isn't the wire itself, it's the handling!
You would not believe what a hassle it is to get it off the
spool, measured, and onto a card that won't unravel into a
rat's nest as soon as you open it up. When I figure out a
way to do it the price will certainly go down, I'm working on it.

From: Craig Brunson
Topic: 1937 Message: 1949

We use ~3.5" of 30awg Nichrome wire and heat it with either 2 each 2/3 A (6v) or 3 each 2/3 A (9v) lithium batteries. This is used to cut 215lb, 550lb, & 1000lb nylon cord. It will cut the cord in 3 to 5 seconds. The Nichrome is wound around the cord with 7 loops. This is the standard cutter that we use for NASA & NOAA. It is not affected by the cold & has been tested dozens of times to well over 100k ft.

Good luck

Craig

That is no way close, at least with alkalines anywhere near
room temperature.

I just tested two Rayovac AA alkaline cells, one at a time,
by touching each to three foot long VOM test leads and got 4
amps steady for 10 seconds will *no* noticeable sag. The number
in series will not affect the short circuit amps (either up or
down).

With a solid connection (and not 6 feet of lead) it might have
been a little higher.

At least one consumer application which asks for 1/2 amp for
a long time from AAs is camera electronic flash units.

Hank

1953. Tracking Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-20 04:32:57 UTC
From: Zack Clobes
Topic: 1953 Message: 1953
Attachments: 1 described; binary payloads are missing from this source WARC

I'm wondering if someone would mind checking my predictions that I just ran (in preparation for the 9 March launch). I pulled data from the Dodge City (DDC) and Topeka (TOP) data sets and got landing predictions that were about 40 miles apart. I've attached a map that shows the two predictions.

The top path was from the Topeka data, and the bottom set was from Dodge City.

The soundings came from http://www.met.fsu.edu/CUDOS/cgi/ezuacode.html. It was about 8:00pm (central) on 19 Feb 2002 but I can't seem to find a date/time from the report.

I'm using the latest version of Balloon Tracker (from EOSS).

Thanks,
Zack Clobes, W0ZC

Sure, but we have to know your ascent and descent speeds
and burst height. Burst height may be on the map graphic
but it can't be read with the overlapping labels.

You can get ascent speed and burst height from LIFTWIN .

http://www.geocities.com/n1ltv/liftwin.htm

From: Mark Conner
Topic: 1953 Message: 1955

The original post didn't go to KNSP, but this reply will.

Instead of using DDC or TOP observed soundings for your predictions, I would recommend using a forecast sounding for HUT.

Go to this website
http://www.arl.noaa.gov/ready-bin/profsrc.pl?metdata=MRF+191+km

and enter "HUT" for the ID. Then select the time period you're interested in on the next page (max of 288 hours or 12 days out) and generate the sounding. When you see the graphic, click on the "Sounding text and any error messages" link and save that text file. You can import that into Balloon Track and use those winds.

When you get within 60 hours of launch, go to this page:
http://www.arl.noaa.gov/ready/cmet.html

and select either the Eta 91km or AVN 191km next to the forecast soundings block and proceed as above.

Dodge City and Topeka are a little far away to use, and today's winds won't tell you much about a March 9th launch. The forecast soundings will be better once you're within 12 days of your launch date.

Thanks for the pointers - I realize I'm a bit too far out to predict anything, but with the first two launches, I didn't feel that the predictions were telling me anything. They just seemed to change far too much from sounding to sounding and day to day. I'm trying to get better prepared for this one.

How accurate do you feel the sounding predictions are one to two days before a launch?

1957. Re: [tvnsp] Tracking Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-20 04:05:38 UTC
From: Mark Conner
Topic: 1953 Message: 1957

It depends on the situation. If there are radical changes in the weather happening on the day of the launch, then the predictions are not as good. When I get within two days of launch, I use wind data from predictions +/- 6 hours of launch time to see how much they vary - if they change a lot, I have less confidence in the particulars of the prediction.

The one place where I use the current sounding data is above 65,000 ft. The models do poorly up high, and the winds don't change a lot from day to day. So I take the current sounding and use it to replace any model data above 65,000 ft. Otherwise I don't use current soundings for much, except as a last-minute check on launch day if I can get the 12Z sounding. Your distance from either TOP or DDC makes it hard to use a sounding for even that much.

Also, with long-range predictions I check out what NWS is saying about how the models are doing. It takes a lot of interpretation, but you can use http://www.hpc.ncep.noaa.gov/discussions/pmdepd.html to see what they're saying. If there's a lot of talk about "low confidence in the models", then take any predictions you make with them with a grain of salt.

Paul, do you mean you didn't get satisfactory heating/melting
with the AAs, or that you didn't meter the current/voltage?

Was the camera battery a lithium type?

This has been an interesting thread. For one thing now I
know where to get nichrome wire for a foam cutter.

I have one more question, how long is the cable from the
nichrome to the nichrome heating battery? With these high
currents and low voltages, cable and battery socket resistances
can have a large effect on the power that gets to the nichrome.

The nichrome wire didn't get hot.

> Was the camera battery a lithium type?

The battery is a $10, 6 volt, lithium camera battery. I think it's
2CR5.

> I have one more question, how long is the cable from the

From the battery to nichrome is about 2".

What's typically used to heat nichrome for foam cutting? I have some foam pieces I'd like to cut for use in my capsule construction - a knife doesn't work too well. I have a 15V 8A supply for my NiMH charger and a 13.8V 25A supply for running my home APRS station - just wondering if either of those would be suitable or whether I'd need to buy something purpose-built.

Unregulated AC at a few amperes (1-3).

> I have some foam pieces I'd like to cut for use in my

Anyone who has worked with styrofoam for a while finds out
how sloppy cold knife cutting can be. :)

Mark, this would work in that you have more than enough voltage
and current, but a simple hefty filament transformer fed by
a Variac for adjusting cutter current would be much better.

I'll check my foam cutter tonight. but I think those voltages are in
the right range. The foam cutters don't glow orange hot like the line
cutter does.

Or a TRIAC for current adjustment. A lamp dimmer module
could be modified to run on low voltage and then you'd
have that part factory made.

From: verhap@occ1.sd01.k12.id.us
Topic: 1969 Message: 1969

I had one of my students run an experiment with the cutdowns I designed. Bill and Mark, make sure you use the 5 volt reed relays. Radio Shack makes a 12 volt relay that won't work. I don't know which relay I gave the part number for in my instructions.

When driving to school last Friday, I heard on the radio that Eagle High School had been closed on Thursady because a student lit a smoke bomb. The report went on to say that the student used a timer to light the fuse. I realized at that time that Kevin was experimenting with my circuit in class. I have visions of the police waiting for me once I got to school.

Everything turned out alright. It turns out that Kevin goes to the other Meridian high school. I also found the circuit in his tool drawer, he hadn't taken it to school with him. Just to be save, the cutdown is on my desk. Kevin will still test it, but he won't take it with him to shcool.

Help!

No one has said they can help out at the Mall on Saturday, however I have had two tell me that they can't make it. The TVNSP table needs to be manned from 9:30 AM to 9:30 PM. I plan to be there all day, but will need time to get lunch and dinner.

Please let me know when you can help out.

Paul

From: Mike Garske
Topic: 1975 Message: 1975

Hello all,

I don't seem to get all the stations mapped in Street Atlas under the Track section....is there a setting to send everything heard to the map? Or do I have to pick the ones I want? I can get a map of some of the stationary reports, but the mobile station stay on for about 10 seconds and then disappear. Give me some suggestions, or settings I need to adjust! Thanks!

Mike KC7DPD

P.S. I have my APRS going right now if anyone is looking at it.....8:11am

Go to the Maps tab and pick Map #2. That should give you all stations
plus show tracks for moving stations.

If you map "tracked" stations, then that is all you get - none of the
others will show.

1977. unproto / APRS symbols etc.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-21 16:26:16 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1977 Message: 1977

Question......
what should my unproto settings be on my TNC?
When I did the backpacking thing I used
UNPROTO APTERM VIA R0MIR (Through the MIR)

What do I set it to if I want it to be wide3-3 for example?
do the wide settings go here?

The basic stamp is configuring the TNC manually for APRS...
It is working as of last night.... The serial GPS data is being
parsed, and combined with telemetry data and then put in the APRS
format.... And output to a TNC that is put in converse mode.
such as:
=DDMM.SSW/DDMM.SSNgblah blah blah blah blah
WinAPRS seems to recognize me just fine, I think my UNPROTO settings could
be better though...

As for the APRS symbols...
I'm using "g" for "hang glider", what do other folks use for near crafts?

I program a Wide3-3.

> As for the APRS symbols...
> I'm using "g" for "hang glider", what do other folks use for near crafts?

I use a SSID of 11, which is the standard for balloon. There is a
symbol for balloons (hot air ones, unfortunately [1]), but I don't
recall it off the top of my head

Paul
1. Hot air balloons only go a couple thousand feet up- those wimps!

I definitely want to try 32/34/36 , but Hanks email said he found it much
cheaper.

Okay, 10 cents a foot so far.

Aerocon Systems may want to license Wiretronic its technology
for handling the nichrome wire nuisance so well that it can sell
nichrome wire for less than 1/25th the price of Wiretronic! :)

I'm trying to locate the webpage for the Arizona model rocket
place. Its free wire offer is still in effect, but it may take
3 months for it to come through (only 4 shipments a year for this
freebie).

Hank

A Model Rocket Outfit in Arizona

Resistance Wire

Nichrome Wire - 36 gauge
36 gauge. NiChrome-60 alloy. Perfect for electrical ignition
of rocket motors and for "electric matches"
To order: ft @ $.20 per foot

Nichrome Wire - 27 gauge
27 gauge. NiChrome-60 Alloy. Heavy-gauge resistance wire perfect
for heavy-duty foam/plastic cutting, DIY electrical furnaces,
DIY power resistors, etc.

Caution: Don't use this stuff for small igniters...use the 36
gauge for this purpose
To order: ft @ $.35 per foot

DR> I definitely want to try 32/34/36 , but Hanks email said he
DR> found it much cheaper.

This is the lowest I found. If people wanted to split
this about 5 ways it would be very economical.

A little coil of this fine wire would go in a first class envelope
with just a few stamps.

I'd like to have 5 or ten feet of 34 gauge wire just because this
is the only size this outfit has. It's the popular size for rocket
ignition, but that's a different thermal situation than cord
cutting. As Tony mentioned earlier, the free air temperature
chart at Wiretron doesn't apply too much to the geometry where
the wire is in close contact with the cord that's being cut, although
there will still be an advantage to the smaller thermal mass of
the smaller gauge wire.

It's more the total power dissipated in the nichrome that counts
for cord cutting, so the choice of gauge should be based primarily
on getting the most power out of the available battery. Thus
the wire gauge is a way to adjust the resistance for maximum
power where half the power is dissipated in the battery internal
resistance and half in the load.

This analysis can be done methodically without the need for much
experimentation *if* you have the basic battery characteristics.

I made some quick battery measurements a few night ago on a few
rechargeables I had around and the AA alkaline cells.

David,

In that case you go ahead, and let me just mention that
I refound the other rocket place's website that sells
nichrome 36 gauge by the foot at 20 cents per.

http://www.ssaerospace.com/

You can check out its shipping guidelines and see if being
able to get less than a 50 feet length might come out better.
Just a few feet will go a long way.

There are two other choices if you want a balloon symbol on APRS:

1) Use "UNPROTO GPSPO VIA WIDE3-3". GPSPO gets you the balloon icon
and WIDE3-3 does the digipeating. This works for when you're sending
raw GPS strings.

2) Use "O" (capital O as in Oscar) right after the "W" for west
longitude in the APRS position report. WIDE3-3 has to be set in the
UNPROTO if you want the digipeating.

EOSS, ANSR, NSGB, and most others I know use the hot-air balloon icon
for their APRS stuff when possible.

Thanks Mark,

So what is the difference between
UNPROTO GPSPO VIA RELAY,WIDE3-3
and
UNPROTO GPSPO VIA WIDE3-3

from:
http://nwaprs.org/aprssettings.htm
There solution was identical to yours except they used:
UNPROTO GPSPO via RELAY,WIDE3-3

http://www.waars.org/temp/APRSArticle.htm
<http://www.waars.org/temp/APRSArticle.htm>
Putting RELAY first in the UNPROTO path eliminates any home RELAY stations
from digipeating your packets. In other words, setting your UNPROTO path to
WIDE,RELAY, will cause all home RELAY stations to digipeat your packets.
This is inefficient and will cause congestion on the network. Setting the
POS RATE at 2 minutes for mobiles and 30 minutes for base stations will help
with congestion by not beaconing repeated positions from the same station
over a very short period of time. Two minutes for a mobile should be enough
to get a good track.

Ok, 30 feet of the 36 gauge is on the way for $11.14 including
shipping. Send a SASE, and include some cash if you feel so inclined.
And I'll try to get some to Paul next time I see him...

David,

In that case you go ahead, and let me just mention that
I refound the other rocket place's website that sells
nichrome 36 gauge by the foot at 20 cents per.

http://www.ssaerospace.com/ <http://www.ssaerospace.com/>

You can check out its shipping guidelines and see if being
able to get less than a 50 feet length might come out better.
Just a few feet will go a long way.

Hank

Stephanie,

The Boise Public Library is on the west side of Capitol Boulevard just
north of the river on the southwest corner of Battery and Capitol.

I'm not sure where the auditorium entrance is, probably on 9th, or Battery,
or the southwest corner of the building.

1992. Re: [tvnsp] unproto / APRS symbols etc.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-22 01:29:13 UTC
From: Mark Conner
Topic: 1977 Message: 1992

I would not recommend using RELAY on a balloon. Since you're at high altitude, practically every home station and digipeater hearing the balloon will try to digipeat the packet. This could lead to tons of QRM as everyone tries to digipeat at once.

The recommendation below is based on a ground station that would have only 1 or 2 RELAYs within range, and is not quite accurate. Any home station hearing a mobile direct should digipeat a packet with RELAY in the first position, so it can then go on to a WIDE that might not have heard it. If it used WIDE,RELAY then every home station in range of the WIDE (not just the mobile) would digipeat it.

WIDE3-3 may be more than needed on a balloon too, but the dupe reduction by using the WIDEn-N means less QRM than would occur by using WIDE,WIDE. WIDE2-2 might be plenty.

I don't use either RELAY or WIDE on my balloons, opting to go with a direct path only. The only time I can think it would be useful on a chase is when the balloon gets far away from me, but lands within range of a WIDE. There aren't many WIDEs in my landing zones, and we try not to let the balloon get too far in front of us.

From: Mark Conner
Topic: 1993 Message: 1993

Found this on APRSSIG. The unit is available for about $150.
The low-voltage version has a 80mA power consumption, the
high-voltage version varies with input voltage. Looks like a
possible replacement for the GPS-35, except the weight is 11 oz
with the cable. But hey, 3-meter accuracy.

>So what is the difference between
>UNPROTO GPSPO VIA RELAY,WIDE3-3
>and
>UNPROTO GPSPO VIA WIDE3-3

I haven't seen this completely explained yet so I'll toss in some basic stuff first.

The GPSPO portion is the destination. In APRS usage it's used in a couple different ways. Strings starting with AP generally indicate which client is being used. The next character indicates the program and the following 3 indicate the version. (i.e. APS206 would indicate APRS+SA version 2.06 <--- Going from memory there) Strings starting with GPS are one way to select the symbol used.

The part after the via is the path to be used. Your packet must hit each specified name in order or it stops. I've seen at least one person make a typo in "relay" and the packet stops dead.

The wide3-3 part (also referred to as wideN-N) is a modification to the normal rules in that digi-peaters that know how to handle it will (a) forward it on and (b) keep track of the fact that they've seen it already and not resend it if they see it again soon. If you used wide,wide,wide instead digi-peater A could hear it and send it out so that B could hear it and then A would hear it from B and send it again. WideN-N solves that. When a wideN-N digi retransmits a packet it will decrement the last number. If you see a packet with wide3-1 in the path it means it has been sent on by 2 wide digi-peaters.

In this area there is almost no reason to use relay in your path and, in fact, it's somewhat detrimental to do so. A balloon makes that even worse. However, most of the wide digis in the area will also answer to relay so your packet would make it out. (Several times most likely)

In the Boise area Wide2-2 is usually more than enough. I'll occasionally use Wide3-3 if I'm venturing a ways out.

HTH
Bill

p.s. If you really want to wish you had never asked go monitor the APRSSIG for a while. They currently have a holy war going on what the "correct" path is -and- a holy war on noid vs. id for wideN-N digipeaters. Anybody got a spare D key?

I was going to post to aprssig about the three
balloon launches this weekend, but looking over
the topics of discussion there, now I'm not sure
it would make much difference.

Anybody have thoughts about how to get the word out
that our balloon events are even happening?

I don't subscribe to aprssig so I'd just be getting
on temporarily to post, and then getting out.

Hank

The Delorme GPSTripMate I got (the $50 remanufactured one with
no user interface designed to be used with a PC) uses 80 to 110 mA.
When it's "searching" (not very often, only on startup for 10 minutes)
it's at 80 to 95 ish... once it locks it operates around 110mA....
just my 10 cents worth..... it's only a power savings of 30mA.....

From: Ralph Wallio, W0RPK
Topic: 1997 Message: 1999

These panels are manufactured by Iowa Thin Film Technologies, http://www.iowathinfilm.com/. They were flown on ISU/HABET missions back in 1997 to test performance in high altitude environment. Efficiency is around 5% which compares with roughly 10% for inexpensive hard cells, 12-15% for the expensive stuff and 18% for very expensive space-rated cells.

See the Iowa Thin Film web pages for a long tutorial on power calculations, http://www.iowathinfilm.com/calculations.html, and sources for consumer quantities of their products, http://www.iowathinfilm.com/links.html.

Hank

Go ahead and post the info. They need a different topic as
someone earlier mentioned. All they do is argue and try to
one-up each other lately. It has gone from an informational SIG
to a "I know more than you" bragging forum. In the beginning
it was a good APRS newbie training ground. You will pull some
people toward ballooning as i was.

I learn more from lurking on this SIG than any other i subscribe
to. Got some awesome folks here with a lot of different scientific
backgrounds. Makes for interesting reading ;)

By the time i check my mail which is only once a week lately
most questions are responded to before i can offer my meager
assistance. You guys must live on your computers..hi..hi.

Only 52 more emails to read,73's

This site explains power sources,wire diameters and lengths.

http://www.techlib.com/hobby/hotwire_foam_cutter.htm

Here is a novel idea using light bulbs for two purposes.
Voltage control and as a work light.

http://www.canadianhovercraftfederation.org/FAQs/2foam_cutter.htm

Of course there are a zillion other sites using "Google" and
few key search words.

Mark Conner wrote:

2002. Re: [tvnsp] Telling the outside world about this weekend in ballooning

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-23 01:07:56 UTC
From: Hank Riley
Topic: 1995 Message: 2002

Randy,

Mark has already taken care of aprs list, so I'll
do AMSAT list.

This is a pretty good list for sure.

One or two online visits a day can make it look like
like one lives on the computer, especially if those
visits are lingering ones. :)

And quite a few of the hams online have occupations
that have them connected to email during at least part
of the day.

> http://www.techlib.com/hobby/hotwire_foam_cutter.htm

This is bad:

> Here is a novel idea using light bulbs for two purposes.
> Voltage control and as a work light.
>
> http://www.canadianhovercraftfederation.org/FAQs/2foam_cutter.htm

Folks, never build anything that exposes people to conductors
that are at line voltage potential such as this arrangement
does.

I know you shouldn't be touching the wire if it's hot (thermally)
anyway, but the electric shock hazard is so severe that this
scheme of plugging a bare wire (so out in the open no less and
near hands) into the line voltage should just not even be
considered.

The voltage for a decent length cutter is low enough that a
transformer ought to be used anyway.

2004. All three balloons in the air

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-23 17:19:41 UTC
From: Hank Riley
Topic: 1965 Message: 2004

ANSR, EOSS, and NSTAR are in the air right now.

ANSR and EOSS launched only approx. 10 minutes late.

ANSR aa0p-11 kd7lmo-11
EOSS w5vsi-11
NSTAR n9xtn-11 n9xtn-12

I see EOSS and NSTAR on http://www.findu.com, but not
ANSR.

There is an aa0p-9 at the launch site location
near Phoenix.

findu has removed the map track feature temporarily
which is too bad. If anyone has another site that
still provides this track feature please post it
to the list.

2006. NSTAR 02-A successful

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-23 23:04:21 UTC
From: Mark Conner
Topic: 2006 Message: 2006

Quick summary:

NSTAR 02-A launched about 10 minutes early due to increasing surface winds. No problems with the launch itself.

Simplex repeater performance was poor, probably due to using low power setting on HT. Same for backup APRS beacon. Next time we'll use high power on both. It does no good to conserve batteries if no one can hear it. The primary APRS beacon had many malformed position, course, and speed reports, but enough good ones came through to effectively track the package.

Preliminary max altitude is 93,232 ft - will analyze logs later.
N9XTN-11>APRS:/171718h4057.07N/09503.73WO280/014/A=093232
3D09Sats 118FPM C15 NSTAR02A

Landing was about 4 miles east of the appropriately-named town of Gravity, Iowa, in an open pasture with no power lines in sight. Several members of the chase crew saw the terminal descent. Capsules were undamaged and chute was cleanly open. The 1200g balloon shredded almost completely - only a few shards were on the neck. Best I've seen for a 1200g balloon.

Haven't looked at the video yet, but the camera's viewfinder is inoperable now. Worked fine at launch.

Log files appreciated. Anyone who took digital (or has digitized) photos, feel free to overrun my e-mail box.

Many many thanks to all who helped today.

2007. Videotape review

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-24 00:37:13 UTC
From: Mark Conner
Topic: 686 Message: 2007

Got good tape all the way through, at least until the batteries apparently dropped out with 15 minutes of tape to go. The viewfinder is still inoperable. Ralph W0RPK reminded me that this is not the first instance of this happening, and that it may be due to high voltage breakdown due to the low pressure. The only previous flight for this camcorder went to 55,000 ft with no ill effects.

This camcorder had a B/W viewfinder. The previous camera had a color viewfinder (TFT?) that survived to 61,000 feet (Flight 01-A). On its second flight (01-B) the camera flew to 91,000 ft but was destroyed on impact and thus we don't know if the viewfinder failed before or at impact.

I think the camera is still usable for flights, but is no good for "normal" use. The main problem is trying to set the clock or any other parameters. If I hook the video out to a TV, I can't see any of the menu items that the viewfinder would show.

See Ralph's page at
http://users.crosspaths.net/~wallio/HABhv.html for more on this phenomenon.

Good observation and warning Hank

I did not take the time to look this site over closely.
I would personally stay with a DC power source to limit
dangers to the hot wire only.
No need to provoke more than one danger point.

Looks like i may still have to dig out my old
n-gauge train transformers. The radial-arm saw
works pretty good,but the cuts are a little rough.

Here is a meeting and Launch schedule Paul and I
worked up while at the Mall
on Saturday. I hope this will make it easier for
everyone to plan on being
at the launch meetings.

John - KD7HGS

March:
Meetings: 10, 24
Launch: March 30 with prelaunch meeting the 29th

April:
Meetings: 7, 21
Launch: April 20 with prelaunch meeting the 19th.

May:
Meetings: 5, 19
Launch: May 25 with prelaunch meeting the 24th.

June:
Meetings: 2, 16, 30
No Launch scheduled.

July:
Meetings: 14, 28
Launch: Great Plains Mega Launch.

August:
Meetings: 11, 25
Launch: Night launch Saturday, August 10.
Prelaunch: Friday, August 9.

Sept:
Meetings: 8, 22
Launch: Sept. 7 in conjunction with the Idaho Star
Party.

Oct:
Meetings: 6, 20
Launch: Oct. 5 tentative.

Novemeber:
Meetings: 3, 17
Launch: Nov 2 or 9, tentative.

December:
Meetings: 1,15,29

No launch is scheduled.

Of course, this is subject to changes as necessary.

From: John Knapp
Topic: 2011 Message: 2011

During April, there are two other events which the
Treasure Valley Near
Space Project will be involved with.

On April 13, I will be at a Boy Scout Competition
called Willow Creek with
the Snake River Ameture Radio Club communications
trailer. I would like to
set up a capsule and APRS to demonstrate along with
the information and
demonstration we do on ham radio. Any voluteers would
be appreciated. I will
be taking the trailer up on Friday, April 12 and
returning Sunday, April 14.

Also during April is the SNARC Hamfest. It will be on
April 27 and will be
at the Vallivue Middle School (?) - the old
Highschool. A booth will be set
up during the Hamfest. Volunteers will be needed
during the Hamfest. Please
let Paul or I know if you can help.

Thanks
John - KD7HGS

2012. Photos of capsules/initial debug

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-25 04:42:26 UTC
From: Mark Conner
Topic: 2012 Message: 2012
Attachments: 2 described; binary payloads are missing from this source WARC

Attached are two pictures of the rebuilt NSTAR capsule after its maiden flight. One of the pictures has the TVNSP patches that flew to about 92,798 ft (still awaiting more logs for final reading).

The other photo shows the capsule zipped up with the rubber duck antenna sticking out of the top. Attached to the side is a laminated card with an American flag on one side and a brief explanation and finder instructions on the other. I provided the PIN numbers for a half-used phone card in case the finder doesn't want to pay for a long-distance call. In case the card falls off, I put my cell number, home number, and e-mail in waterproof permanent marker inside and out. I have this in a MS Word file that is formatted to print to Avery 4x6 post cards if anyone is interested (no, you won't get the phone card numbers in that version :P)

I think I have a handle on why I got bad position reports out of the capsules yesterday. All the bad reports came between :15 and :20 after each minute. The program monitors the time from the GGA string and when it crosses :15, it polls the ADC, formats a telemetry packet for transmission, then sends it to the TNC. Right afterwards it waits to read the next GPRMC string to get lat/lon/course/speed. At about the time it's getting the data from the GPS, the TNC is keying the radio. I think that's injecting garble into the serial data. Because I'm using a rubber duck instead of a J-pole on a string of coax, the RF near the GPS and controller is a lot stronger than on previous flights.

The transmission at :45 does not poll the ADC and format a telemetry packet, so those went out with clean GPS data.

So now I'm faced with a choice of putting a J-pole back on the payload (and asking to short powerlines again), shielding and RF-choking the controller box (ugh), or avoiding the problem by moving the telemetry packet transmission to a different time in the cycle. If I'm TXing a position packet while I'm trying to read the ADC, I get bogus data from the ADC - this is why the telemetry was transmitted before the position report in the first place.

I remembered that I did not use shielded cables to connect the DB-9 on the controller box to the circuit board. I may go ahead and replace those as a quick easy fix. Otherwise I'm going to follow the path of least resistance and deconflict my transmitting and data reception.

I know several people monitored the flight via the Internet. I would be interested in any and all direct RF reception reports for this flight to evaluate the antenna's performance. I think the signal was not as good as the J-pole, but it seemed adequate for the chase teams (until we got in the null as we stopped right under the capsule shortly before burst).

2013. NSTAR photo makes Omaha World-Herald

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-25 05:15:16 UTC
From: Mark Conner
Topic: 2013 Message: 2013

Forgot to mention - the photographer did make it out to the launch site and took a bunch of photos, one of which made the bottom front page of the Midlands section (local news for those of you not familiar with the Omaha paper). Shari has it at the moment so I can't scan it in and share it with everyone. There was a two-line blurb under it that said the balloon would go 15-20 miles high and was forecast to travel about 90 miles downwind. We ended up going closer to 60 miles downwind in reality, but oh well.

No one was specifically identified in the picture, but if you know the players Doug KA0O had his back to the camera and Wayne KE6DZD and Scott Clark could be seen. I think others were in the frame but can't remember who at the moment.

Since there was no story, it doesn't seem to be on the World-Herald's web site. Or at least I couldn't find it.

Date: 2002-02-25 18:31:57 UTC
From: Mark Conner
Topic: 1965 Message: 2016

Findu is changing server locations, as K4HG will not be able to continue it at its current location. TAPR is collecting donations to fund a redundant server (it's not a TAPR project -they're just a conduit for the money) and I believe a new location has been identified for it.

So in the near future the reliability should be better and the functionality will probably grow too. I think K4HG had to disable the map track feature because it was too hard on the server.

> occasionally
> use Wide3-3 if I'm venturing a ways out.
>
> HTH
> Bill

In the beginning, RELAY and WIDE were also used to differentiate between local versus long distance APRS data relaying. Generally, trackers and other local short-hop units would have an alias of RELAY while the main digipeaters would have an alias of WIDE. This enabled better coverage of areas that were out of reach from the WIDE digipeater. So, I could be driving around in my vehicle with my tracker as alias RELAY and someone who couldn't hit the Cinnabar repeater directly (to use a local example) wouldn't be able to get out with UNPROTO GPSPO VIA WIDE3-3. However, using VIA RELAY,WIDE3-3 instead, he might hit my tracker which would take care of the RELAY and send it with the RELAY marked as used on to Cinnabar which would pick up the WIDE3-3 part and send that on as WIDE3-2.

As Bill H. mentioned, some of the WIDEs also recognize RELAY. So, using RELAY,WIDE here and hitting Cinnabar, you'd be doing the same thing as WIDE4-4. Depending on your needs, this may or may not be what you want.

An area where a RELAY alias is useful is my home area. For some reason, it seems as if in certain parts of Nampa and Caldwell I can't hit Cinnabar

running APRS but can hit my QTH. This is whether or not I can hit Cinnabar by voice. Something I've not yet figured out. Anyway, as a result, when my QTH is on the air and running APRS, it's got an alias of RELAY, which allows me to get out from those "blind" areas by using VIA RELAY,WIDE3-3. A similar system could be used for other blind areas.

So, what to do if you sometimes need RELAY, other times don't? Set up one LTP with VIA RELAY,WIDE3-3 and another with VIA WIDE3-3. If there's a RELAY in the area, it will send it on and if there isn't one in the area, but you can hit a WIDE, you're still covered with the second one.

The really critical thing to keep in mind is, if you use VIA RELAY,WIDE3-3 and there is no digipeating station in the area with an alias of RELAY, you're stopped cold there. Of course, the same thing happens if you can't hit a WIDE and are using VIA WIDE3-3.

Hmmm. I think my typing runneth over, so I'll shut up here.

Scientific Wizardry would love to have us set up a table on a Saturday. any Saturday will work for them, even if we give them short notice.

I'd like to set up a table this Saturday. The store is open from 10 to 6. They are closed on sundays.

Can anyone help out this Saturday? It's the same as the Mall last week, I'd like to have someone drop by so I can go out for lunch.

At the store we should get a lot more interest, since people are in the store for science stuff.

The store is located on Fairview, at the 10,000 block. They're on the the south side of the road, across from a boat store.

Topic: 1965 Message: 2020

This is the story of my life... I've been up on APRS for about a week and the server goes away.
The same thing happened when I finally got my SSTV setup working..... I got online and downloaded a
couple of pics of junk over a couple of days (junk because the cosmonauts on the MIR didn't snap
good pictures, or stuff wasn't hooked up correctly) and then they turned it off forever... actually
SSTV did come on once for field day... but no more.....

Man I hope this comes online fast :) APRS is only 'cool' with the database....

Subject: Re: [tvnsp] All three balloons in the air

Findu is changing server locations, as K4HG will not be able to continue it at its current location. TAPR is collecting donations to fund a redundant server (it's not a TAPR project -they're just a conduit for the money) and I believe a new location has been identified for it.

So in the near future the reliability should be better and the functionality will probably grow too. I think K4HG had to disable the map track feature because it was too hard on the server.

Subject: [tvnsp] All three balloons in the air

ANSR, EOSS, and NSTAR are in the air right now.

ANSR and EOSS launched only approx. 10 minutes late.

ANSR aa0p-11 kd7lmo-11
EOSS w5vsi-11
NSTAR n9xtn-11 n9xtn-12

I see EOSS and NSTAR on http://www.findu.com, <http://www.findu.com,> but
not
ANSR.

There is an aa0p-9 at the launch site location
near Phoenix.

findu has removed the map track feature temporarily
which is too bad. If anyone has another site that
still provides this track feature please post it
to the list.

Hank

Findu is still working, sort of. I was able to get my balloon posits from the database on Saturday, and it's working right this minute showing my car in the parking lot outside my building. However, the server is often slow or unavailable. The upgrade and move should improve it's uptime/speed.

David

Try this link if you do Java. Also go to AE5PL's site and it has some search features. Not as robust as Findu,but he is working on it.

http://www.ae5pl.net/html/allaprs.htm

Findu.com has a few hiccups once in awhile, but it is not going away! Some Big Guns are preparing to take over the system administration from Steve Dimse the father of Findu. He just not have the time to devote
his many talents full time to the project. I think we will see more stability in the future. It really has done surprisingly well,stability wise,considering the huge popularity of the system since its inception a few years back.

Findu is one of the Major home run hitters for APRS.
Be patient,it has a few more years of service ;)

2025. Fwd: [aprsplus] findu.com backup server donation clarification

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-27 16:54:48 UTC
From: Mark Conner
Topic: 2025 Message: 2025

Since we had a discussion about FindU on this list, I thought I would forward this information.

73 de Mark N9XTN

==========

Good morning everyone. I need to issue a clarification for those wanting to make a tax donatable donation to the findu.com backup server. If you are wanting to make a donation and receive a letter letting you write it off you your taxes, you will need to make the check to the DCARC and in the notes column it is critical that you indicate it is for the findu.com backup server. If you do not want the letter, you can send the donations to either TAPR or the DCARC. Make sure that you indicate that it is for the findu.com backup server. Donations from clubs as well as individuals are welcome. I am not a member on many APRS and weather related mailing lists. Please pass this on to those lists.

Thank you for your help and donations.

2027. cutdown device

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-28 18:56:38 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2027 Message: 2027

I was searching the archives for the regulations on cutdown devices... and found this:

> That takes care of one cutdown device. I suggest the second be a
> combination of a timer and a way to send commands up on the APRS link.
> I believe you aren't doing anything with receive audio from the
> transceiver in the tracker, so how about adding a DTMF decoder that
> listens for a specific sequence of tones to trigger the cutdown.

I just got this working last night.
I hate to send out attachments in shotgun fashion.. but i have the pspice file
with the schematic, basic stamp 2 code, and images... it works great.
If you want the details just say so.

Now the hard part is the timer based version..... My code is already maxing out the basic stamp, and in order to count that high.... I'd have to have 4 or 5
byte level variables and quite a if then structure to know when 70 minutes went by...
(and 20MHz....)

Do I HAVE to have a timer backup? If so, I probably will need an external timer solution...

Currently... if i interpret the archives correctly, a latex balloon is considered it's own cutdown
device because it will pop, and I do have a remote control cutdown operational.... so MUST
I have a timer based cutdown? Can anyone suggest a fast solution internal/external to the BS2?

Counting that high requires a lot of code and several variables... big code for a little feature.

There are several stand-alone real-time-clocks that should work. The one I have will have an alarm line set in - so many min. from the start time. You could have the stamp set the timer at launch. The alarm will be active for a determined amount of time so that you can check it at any interval.

Hey Paul,

What do we know about the condition of the line at the time we want to cut it? I would imagine its temperature is at least 40 below zero. Is the nylon line brittle at this time and temperature?

Thanks,

Tony

2036. Scientific Wizardry

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-28 23:36:32 UTC
From: Tony Barrett
Topic: 2018 Message: 2036

So Paul,

Do you still need someone to help you at Scientific Wizardry tomorrow? What times? How long?

Tony

2037. Publicity

Topic: 2037 Message: 2037

Hey Paul,

HP sponsors a "visiting scientist" program where engineers go into the classroom (mostly grade school and middle school) once a month for an hour or two and put on various science demonstrations. HP maintains a room full of science demonstration kits. I wonder if we could put together something on Near Space for this program. You might even want to trade demos with the schools you work with. You could inspire some kids to come out for a launch and to bring their families.

Just a thought.

Tony

2038. RE: [tvnsp] cutdown device

From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2027 Message: 2038

I'm guessing your considering a high altitude cutdown devise of some type...
don't forget, your cutdown device must work at a wide range of elevations
and
flight times... and not depend on air temp...

The operator shall activate the appropriate devices required by paragraphs
(a) (1) and (2) of this section when weather conditions are less than those
prescribed for operation under this subpart, or if a malfunction or any
other reason makes the further operation hazardous to other air traffic or
to persons and property on the surface. <http://www.eoss.org/pubs/#_ftn8>

Hey Paul,

What do we know about the condition of the line at the time we want to cut
it? I would imagine its temperature is at least 40 below zero. Is the
nylon line brittle at this time and temperature?

Thanks,

Tony

The cord could be warmer because of sunlight shining on it.
Looking at all the recovered load lines, it appears the nylon does
not get brittle (or at least it doesn't break from being brittle).

The thermal knife works fine in the cold. We encase it in a block of
styrofoam to protect against fires. The foam also keeps it
insulated. I'm not aware of any case of a failure of thermal knifes
due to temperatures. I imagine though that it would fail if there was
high winds blowing across the coil.

2042. RE: [tvnsp] cutdown device

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-01 17:28:02 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2027 Message: 2042

I was thinking Tony was going to take advantage of the brittle load line....
in which case a mechanical cutdown device that depends on the rope being
brittle may not work if the rope were soft and pliable at lower elevations
(warmer temps).

I love the idea of a mechanical load line chopper, but I think we should
steer
away from depending on any particular environmental condition in order for
the
device to function properly.

Date: 2002-03-01 17:29:48 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2027 Message: 2043

also, I'm guessing the stack goes like this:

balloon
load line (cutaway here somewhere)
parachute
craft

so when the cutaway device activates, when the load line
is cut, then the red hot cutaway device falls down onto the
parachute? What is your configuration to keep the cutaway
from melting the chute?
Dave

The thermal knife works fine in the cold. We encase it in a block of
styrofoam to protect against fires. The foam also keeps it
insulated. I'm not aware of any case of a failure of thermal knifes
due to temperatures. I imagine though that it would fail if there was
high winds blowing across the coil.

> from melting the chute?

The timer operates the thermal knife for only 1 minute (but not at a 100% duty cycle). The knife is locked inside a styro box, but can't touch the sides of the box. It gets warm inside, but doesn't melt a hole through it.

Paul

2045. timer for cutdown device

Paul,

The whole cutdown thread has been interesting, but it seems like you've already built and perfected this "wheel." The thermal cord cutter has also been used by countless others of course.

You've described the knife and its enclosure already, but I think a few people would like to know a bit about how the delay is accomplished, since David has given the impression that the use of the BASIC Stamp for doing long delays might be cumbersome (at least delays that will allow other tasks to be attended to).

This is the only thing I've been able to find regarding the subject of timer implementation in previous messages:

PV> The flight computer and stopwatch will be two
PV> other mechanisms.

If you can, please give just a few details if it's done in the Stamp.

I have the stopwatch "ring" a transistor in place of it's speaker.
That allows current to flow through the relay, turning on power to
the nichrome coil. As long as the stopwatch rings (one minute), it
operates the thermal knife.

Anything can operate the transistor switch. I have wired up a pager
to it, but we couldn't ring the pager during the flight. I'll look at
getting a wider area of coverage for future tests.

Paul,

I don't know what the "stopwatch" is for sure. I guess
it's something completely apart from the BASIC Stamp and
it's some kind of consumer timer (maybe a kitchen cook timer)
that you've hooked into the cutdown circuit as described.
Before this message, I thought this was not a literal stopwatch,
but just the name for a function implemented within the Stamp.

What I'm trying to get at is if it is indeed cumbersome or
impossible to do a "background" hours long delay in the
Stamp in *Stamp-contained* software alone. It seems as if
that conclusion is correct, and therefore the Stamp needs an
external "helper timer" of some sort as has been discusssed.

So, to summarize, I'm interested in the *generation* of the time
delay itself, not the activation or interface circuit and method.
If that point could be established, then I've got a suggestion
to make regarding the implementation of an external timer that
would be very reliable and simple.

Hank

Oops, sorry for the confusion. I use a stopwatch that I bought from
Walmart. It's the ATQ2, a $5 stopwatch in the jewelry department
of Walmart. I removed the piezo spreaker from the back and
connected wires to the springs that made contact witht he piezo
disk.

We set the timer the night before the launch.

Send me your address and I'll send you a length of nichrome and
documentation on the circuit.

> Hank, it is literally a stopwatch, the kind you buy
> for track, etc.

John,

Thanks for establishing that point.

Now if Paul could just comment on doing delays
within a Stamp as a *background* task. I see that
the PAUSE statement would allow for multi-hour
delays, but nothing else would get done.

This is fully acknowledging that Paul's stopwatch
method ain't broke and doesn't need fixing. :)

While we're sort of on the subject of dual-redundant cutdown devices.....

Is a common battery, circuit, and nichrome coil tripped by one of two separate methods considered a dual cutdown device? I think I would prefer two coils, two sets of batteries, two circuits, but one on the stopwatch and one on the pager/BS2 output/DTMF controller/etc. This would prevent a single failure point from causing the cutdown to fail. But I haven't even built the first one yet. :)

I would have to consider the use of a single battery source, circuit, and nicrome coil as one cut down device, even if there were two seperate methods of cutdown. You are correct, you have a single point of failure, esp. with batteries. But if the circuit or coil some how failed, it wouldn't matter how many tripping methods you have, they won't work.

My two and half cents worth

I've found much cheaper prices on those popular 3 volt
lithium camera batteries. I think a group buy would
be advantageous, and I'd be willing to do that.

Why don't you just watch the time and/or altitude data coming from the GPS to determine when to cut the balloon down. You could even go a step forward with that and make the condition that if the GPS data stopped during the launch, the cutdown would automatically fire.

There would need to be a small amount of house-keep/initialization code to go along with it - some code to keep the cutdown from firing on the ground (e.g. during power-up) comes to mind.

Since the BS-2p and it's brethern are not multitaskers, you can't run a timer in background. The Motorola 68 series micros are capable of multitasking and have background timers. But of course, they're more difficult to program.

I'm working on a second design that incorporates the timer with other signalling methods. As an example, you could connect a pager, flight computer, and timer to one board. Either one could trigger a flight termination.

I believe you're right, that not having the seperate coils, batteries,
etc is not the FAA's idea of redunant cutdown. My latest design
uses a single board, but has multiple coils, batteries, and signals.

The only problem I have encountered is that I need a $10 battery to
operate the coil. Cheaper AA cells won't get the coil hot enough.

Three volt? I currently (get it?) use a six volt 2CR5 camera battery.
They cost $10 at Walmart and are good for only a couple of
operations.

That's pretty much what I'm planning. I have an older circuit design that uses flip-flops as part of a watch dog timer. The BS-1 checks the flip flops for a no-reset event.

Devices connected to the 4 channel flip flops are basically sending a heart beat to the watch dog. When the heart beat stops, the flip flops are not reset. At that point the BS-1 triggers a thermal knife.

Some GPS recievers output a 1PPS. That would be the GPS's heart beat. The flight computer would be required to send a pulse once a minute (or at some other time interval).

We need to order a balloon for the March flight. How do we get the money, or get the bill to VOI?

For $50 we can get a 1200 gram balloon, which will make somewhere around 85,000 feet. For $65 we can get the new 1500 gram balloons, which will get us somewhere near 90 to 95,000 feet.

Which one?

My Prizm can't carry helium tanks. Can someone stop by Shenans and get two tanks? Do we still have a tank lying around? We also need to put money in our helium account. When the welding shop asks, tell them you're with Treasure Valley Near Space and that we have an account with them.

Personally, I think it's important to have a timer and cutdown device that is outside of the control of the microprocessor. (other than perhaps to hold off the cutdown action by sending a series of "I'm alive" pulses)

That way you have a method that should cut it down even if the microprocessor fails.

But if the board fails won't that be the single point
of failure and not be a redundate device?

HR> > lithium camera batteries. I think a group buy would
HR> > be advantageous, and I'd be willing to do that.

PV> Three volt? I currently (get it?) use a six volt 2CR5 camera
PV> battery.

Well, the basic 3 volt cell in your 2CR5 (2 side by side)
is what I'm talking about, a CR123A.

PV> They cost $10 at Walmart and are good for only a couple of
PV> operations.

I've found these 123As for $2, so the 2CR5 equivalent
would be under one-half of Walmart's price. The actual
2CR5 might be around cheaper in bulk, too. The nice
thing about the 123A is that it's easier to run up the
quantity for a bulk order.

Okay, just wanted to make sure there wasn't a trick with
the Stamp that could achieve an interrupt.

> The Motorola 68 series micros are
> capable of multitasking and have background timers. But of
> course, they're more difficult to program.

I don't think there are many small microcontrollers around
now that *don't* allow interrupts. All but the smallest
and oldest PICs do this, and it's the same for Atmel.

Mark,
Would you mind looking over this initial prediction for our 9 March (8:00am) launch. I pulled from your long-range site that you suggested - just want to make sure I'm doing it right.

1300'/min Ascent
1400'/min Descent
78,000' Burst

Thanks,
Zack

The original post didn't go to KNSP, but this reply will.

Instead of using DDC or TOP observed soundings for your predictions, I would recommend using a forecast sounding for HUT.

Go to this website
http://www.arl.noaa.gov/ready-bin/profsrc.pl?metdata=MRF+191+km

and enter "HUT" for the ID. Then select the time period you're interested in on the next page (max of 288 hours or 12 days out) and generate the sounding. When you see the graphic, click on the "Sounding text and any error messages" link and save that text file. You can import that into Balloon Track and use those winds.

When you get within 60 hours of launch, go to this page:
http://www.arl.noaa.gov/ready/cmet.html

and select either the Eta 91km or AVN 191km next to the forecast soundings block and proceed as above.

Dodge City and Topeka are a little far away to use, and today's winds won't tell you much about a March 9th launch. The forecast soundings will be better once you're within 12 days of your launch date.

Subject: [tvnsp] Tracking Predictions

I'm wondering if someone would mind checking my predictions that I just ran (in preparation for the 9 March launch). I pulled data from the Dodge City (DDC) and Topeka (TOP) data sets and got landing predictions that were about 40 miles apart. I've attached a map that shows the two predictions.

The top path was from the Topeka data, and the bottom set was from Dodge City.

The soundings came from http://www.met.fsu.edu/CUDOS/cgi/ezuacode.html. It was about 8:00pm (central) on 19 Feb 2002 but I can't seem to find a date/time from the report.

I'm using the latest version of Balloon Tracker (from EOSS).

Thanks,
Zack Clobes, W0ZC

Zack,

There's a slight inconsistency in the burst tables in
LIFTWIN that has just been discovered in the last week.
I'll try to get you a revised program, but at the very
least will give you revised figures for burst height.

It will be in the direction of an increase by 10 or 15
thousand feet, so that will affect your prediction.

The LIFTWIN burst heights for the 1000 gram and 1200 gram
Kaymonts are legit values from Kaymont (from one of at
least three different tables issued by Kaymont), but
they're not from the same table as for all the other
weight Kaymont balloons in LIFTWIN.

All the other LIFTWIN results are okay except burst height,
time to burst, and radio range.

Hank

Agreed, it ain't broke, but Paul was complaining about the cost and weight
of the special battery used to heat the nichrome, maybe $7 to $10 per
launch. So we're thinking about ways to save some bucks.

Does the nichrome wire eventually melt?

In Idaho it's $57 a tank. At K-state it was $25 a tank. At GPSL
2002 it will be $45 a tank.

2077. RE: [tvnsp] timer for cutdown device

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-03 05:00:28 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2027 Message: 2077

In the BS2, you can perform timer functions and do other tasks...
even without interrupts...

for example (pseudo code)

```
loop:
if myTimerVariable > MaxTimeThenCutdown then CutDownSubRoutien
do anything else you want to do ...
myTimerVariable ++;
goto loop
```

the bad thing about this method is... the execution time of "anything else
you want to do"
will vary.... It would be quite tedious to build a state machine that will
go through all
states in the same number of cycles (with out interrupts)....
thus, the number of times you would need to loop is not simply a matter of
math, but rather,
estimation, and instruction cycle counting....
With interrupts (which the BS2 doesn't have) you could make each loop time a

definite period (say 10 milliseconds or something) and you could set the
variable based timer to cutaway at exactly 70 minutes.

Even if I chose to implement this inaccurate timer in the BS2,
I'm out of variable space already...

Paul,

The whole cutdown thread has been interesting, but it seems
like you've already built and perfected this "wheel." The
thermal cord cutter has also been used by countless others
of course.

You've described the knife and its enclosure already, but
I think a few people would like to know a bit about how the

delay is accomplished, since David has given the impression
that the use of the BASIC Stamp for doing long delays might
be cumbersome (at least delays that will allow other tasks to
be attended to).

This is the only thing I've been able to find regarding the
subject of timer implementation in previous messages:

PV> The flight computer and stopwatch will be two
PV> other mechanisms.

If you can, please give just a few details if it's done in the
Stamp.

Hank

From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2027 Message: 2078

Mark,
I agree with you on this....
yet another reason not to implement the timer on the stamp...

In my case, that would leave me with:
cut down 1: stamp driven DTMF command to initiate cutdown
cut down 2: external timer based (separate power and Nichrome).

Kinda gives me warm fuzzies to have two... can you imagine if that
thing didn't come down... that would be embarrassing.

Subject: Re: [tvnsp] timer for cutdown device

While we're sort of on the subject of dual-redundant cutdown
devices.....

Is a common battery, circuit, and nichrome coil tripped by one of two
separate methods considered a dual cutdown device? I think I would prefer
two coils, two sets of batteries, two circuits, but one on the stopwatch and
one on the pager/BS2 output/DTMF controller/etc. This would prevent a
single failure point from causing the cutdown to fail. But I haven't even
built the first one yet. :)

> Hank, it is literally a stopwatch, the kind you buy
> for track, etc.

John,

Thanks for establishing that point.

Now if Paul could just comment on doing delays
within a Stamp as a *background* task. I see that
the PAUSE statement would allow for multi-hour
delays, but nothing else would get done.

This is fully acknowledging that Paul's stopwatch
method ain't broke and doesn't need fixing. :)

I'd be happy to pick up the helium, i have a truck.
Where is Shenans? This is for the March 30th flight
right? When do I need to pick it up by?

So for us newbies....
the balloons are 1200gram / 1500gram....
what is the cost associated with the helium for these?
Are they the same volume?

I'd sure like to see us do 95K feet and would be happy
to put my money where my mouth was. Seriously, what would
it cost to go to 100K or 120K? What are the prices for the
balloons? and helium?

Dave

David,

That certainly fits the description of "cumbersome."

I'm going to program you an 8 pin timer helper IC that will
have a choice of several pins that will toggle at exact rates
of 10 seconds, 1 minute, 10 minutes, and maybe some other
values.

That way you'll be able to use one Stamp pin to connect to
this helper chip, not have to bother with fancy protocols,
and be able to do nice accurate timings and sequences.

From: Doug Rich
Topic: 2027 Message: 2081

Another way to solve the timer issue and to add some needed capability
would be to use the "Pocket Watch B" from Solutions Cubed.
It has several alarms. One can wait up to 256 hours and stay on up to 256
min. The short version of this will wait up to 256 min. and stay on up to
256 seconds. Either of this would work for a balloon cut down timer,
depending on the flight time. This can be a completely stand alone system.
Supply voltage is 4.0 to 5.5VDC and current is 3.5ma typical to 6.0 ma max.
The alarm pin can sink 18.5 ma. Uses a 1 or 2 wire serial interface. It is
a 5 pin SIP package measuring 1" square (except for the pins).
It will also supply real time clock information so that you can attach
second, minutes, hours days, months and years, if needed. I know time can
be extracted from the GPS system but this takes no code to get it from the GPS.
I don't remember what the cost is but I have had great results using it in
some of my projects. I just looked up the web page and it has the price on it:
http://www.solutions-cubed.com/Products/PocketWatchB/pocketwatchB_main.htm

2082. Braided nylon for load line

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-04 03:51:38 UTC
From: Mark Conner
Topic: 2082 Message: 2082

Is anyone using braided nylon line for load lines on their balloons? During the last flight I noticed once again a tendency for the payload to rotate in a favored direction - I think it may be due to the slow untwisting of the load line. I've been using twisted nylon line for a while now and finally found some smaller braided nylon line.

The stuff I got today is either 1/16" or 3/32" and is on 1/4-pound spools - not sure how long it is, but probably a couple hundred feet anyhow. It comes in flourescent orange and green. It is also stretchier than the twisted nylon, which may be of help for shock absorption, and it holds knots really well (certainly better than the twisted line).

Canfield's (a local sporting-goods store) had a lot of it on clearance for $2.50 a spool and they probably have several dozen spools left, mostly of the green. If anybody wants some I'd be glad to get more and send it at cost plus postage.

I've also updated my web page with map and photo from the last flight - see http://members.cox.net/mconner1/nstar.html for more.

> Are they the same volume?

The 1200 grammers are $50 while the 1500 grammers are $65.
We'd use about the same amount of helium, a tank and a half.

> I'd sure like to see us do 95K feet and would be happy
> to put my money where my mouth was. Seriously, what would
> it cost to go to 100K or 120K? What are the prices for the
> balloons? and helium?

I've planned for the May flight for us to try to break the altitude record. A 3000 grammer would cost $200 while a 6000 grammer would cost $600. I'm working on the half scale airframe for the May flight. We need to break 120,000 feet to make the record Idaho's. We should probably atart looking for sponsors now.

I say we go for the 6000 grammer and try for 130,000 feet. That would give us two flights to practice with.

The capsule will carry an environmental sounder, gieger counter, and APS camera. There will be a second tracker in the recovery system and a thermal knife on the parachute with timer.

I'll bring the stuff to the next meeting.

Date: 2002-03-05 17:09:18 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2084 Message: 2084

There should be a business meeting for VOI and BAS. I'll attend the BAS one. Mike, can you attend the VOI one?

After work I plan to stop by the Warhawk museum. they were closed yesterday. I'll ask them about setting up a display at the museum.

Paul

2085. Bumper Sticker Idea

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-06 14:30:01 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2085 Message: 2085

It was mentioned that a generic near space bumper sticker would be better. How about one that says, "Amateur Near Space", then shows a balloon, and ends with, "Got Helium?".

Inputs?

Paul

2086. May Launch

Yahoo group: tvnsp (2000 — 2002)

From: verhap@occ1.sd01.k12.id.us
Topic: 2086 Message: 2086

The May launch will be a high altitude attempt. We need to start lining up funding. Please pass the word around. We'll put the names of organizations donating on the outside of the capsule. I plan to carry patches up on the flight, to give to donors (they'll be framed with a picture).

Please start asking around.

Paul

You mentioned this quite a while ago. I can't get
too enthusiastic about the "Got Helium" part.

Several very good alternatives were submitted to one
or both of these lists with respect to buying expensive
vinyl bumper stickers. I'd like to see some followup
reaction to those suggestions.

Here are last month's suggestions from the TVNSP list
(Tony's is shortened a bit):

Hey Paul,

Did you know there is bumper sticker paper designed specifically
to be fed through a laser printer? The Women's Challenge makes
bumper stickers out of this material all the time. They just buy
the blank vinyl stock on a carrier sheet in various colors (white,
yellow, orange) and print what they need on demand. That way they
only have to stock the blank media and they never have to worry
about getting stuck with stickers that don't sell.

I work testing commercial color printing presses everyday.
Maybe we could print the bumper stickers while testing other
things.

Tony

Paul, Tony.....

International Paper also makes vinyl bumper sticker stock under
the "invent it!" logo that is for use specifically with inkjet
printers (in fact, it says 'do not use with laser printers or
copy machines' right on the back of the package) and can be
found at Walmart. I have had good experience with the durability
and the print seems to last a good long while. I don't remember
the cost, however, but just thought I'd throw out another option.

I understand perfectly you can get stickers, but the prices
and quantities you mentioned (hundreds of dollars) a ways
back seemed to be a little much.

I'm just pointing out that there seem to be realistic
alternatives that would allow *several* logos to be
implemented, perhaps on a trial basis, and I think that these
alternatives deserve to be recognized and possibly explored
further.

As I recall, it was $300, but I don't remember for how many. The astronomy club is getting bumper stickers for less than a dollar a piece. They were told the stickers were good for five years also. I'm going to find out how they did this.

> I'm just pointing out that there seem to be realistic

I think that's where the laser printer would be a good idea. They say the laser copy is just as good as a printed copy, but I', skeptical.

from Paul's Feb. 8 post to TVNSP list. That's a BOATLOAD of
stickers for a pretty limited target population:

We can order 500 of them, in two colors (three if you count
the color of the vinyl) for $375. That comes out to 75 cents
per decal. They are 3.5 inches in diameter and durable.

2093. Bumper stickers

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-07 00:03:07 UTC
From: Mark Conner
Topic: 2093 Message: 2093

I got an Epson C80 color inkjet printer for $100 after rebates from Circuit City over the weekend. At the high-quality setting with glossy paper, the quality is equal or better than the HP 4500 Color Laser Jet I use at work, especially for photographs. I think the color laser is better for graphics and all-around use, but at $100 for home use the C80 is tough to beat.

The C80 supposedly uses a special ink that is touted to be more fade and water-resistant than "regular" inks. I can't really vouch for that yet after only 3 days' use. I still have trouble considering that anything coming out of an inkjet printer would do well on the back of a car and exposed to the elements, but I don't have any practical experience either.

Anyway, now that I have the printer I'm seriously thinking about creating my own NSTAR bumper stickers. If I ever get off my a** and do it, I'll send TVNSP one to look at. I think Office Depot has a package of 14 bumper stickers for $10 or so.

My NSTAR to-do list is getting longer than my work to-do list......

There are a couple of options to improve the durability. You can cover the completed bumper sticker by spraying on a coat or two of clear lacquer. You can also overcoat the stickers with wide transparent vinyl tape, or run the stickers through a laminator.

The laser printed stickers are extremely durable, no post-processing needed.

From: verhap@occ1.sd01.k12.id.us
Topic: 2098 Message: 2098

The Warhawk Museum is very interested in having TVNSP visit.
They'll allow us to set up a display and to give a presentation.
They have presentations and workshops on the first Saturday's of
the month. April's workshop is about balloons, so we may be
asked to presnt for that one.

When we do launches, they would be interested in having us set
upa tracking station and mission control. They'd even like us to
launch from the airport, outside the museum.

I'll visit with them again on Thursday and start ironing out details.

It looks like we'll have a supporter (although, it may not include
funds)

Paul

Hey Paul, I love the idea of a bumper sticker. Seems like every other type of organization has their own (i.e. geocaching.com & others) Sounds like many are undecided about the design and/or text. Maybe everyone can submit an idea or design and we could take a vote or just come up with something everyone likes. I like the "got Helium" idea. I was talking with my girlfriend and she came up with "got gas?" and "got He?" for some ideas. Anyways, you have my vote for a bumper sticker

2106. Project: Traveler 2002a launch this Saturday

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-08 04:31:18 UTC
From: Zack Clobes
Topic: 2106 Message: 2106

At this point Project: Traveler is still planning on flying Saturday morning (9 Mar). We are planning on launching by 8:00am, but may delay that an hour or so depending on surface level winds.

We will be transmitting GPGGA, GPGGA, and a telemetry string about every 70 seconds (GGA strings are twice as often) using the callsign W0WR on 144.390MHz. Assuming Findu.com is up, Internet tracking should available at http://www.findu.com/cgi-bin/find.cgi?W0WR. ATV video will also be on periodically on 434MHz (See the flight schedule from the link below).

Full flight details are available at http://www.rckara.org/project_traveler/2002a/.
Thanks,
Zack Clobes, W0ZC
Project: Traveler

2109. Warhawk Museum

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-08 14:00:55 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2098 Message: 2109

Don't forget the meeting this Sunday. Brings APRS to test.

We have a date to set up at the Warhawk Museum. The first
Saturday's of the month, they have an educational program. They'd
like us to set up on April 6th, along with a hot air balloon group.
Om Memorial Day, they have a breakfsat. They'd like us to launch
a balloon that day and set up a tracking station at the museum.
Can we move the high altitude attempt to Sunday?

Ball caps.
I want to sew a patch on a ball cap. Do we want to standardize on
a color? That way, when we show up some place with TVNSP
ballcaps, they will match?

Paul

2110. Star Party

There is a star party this Saturday, at Black's Crrek (exit 64 on I-84). It's opened to the public. Please stop by for a visit after dark (if it's clear).

Paul

The sun sets around 6:30 now, but it doesn't get dark for another hour. So you'll want to get there sometime after 7:30. There'll probably be people there until midnight.

To get to the site, take the Black's Creek exit and go north, back under the interstate. There's some curves, be careful not to get back on the interstate. As you get close to the site (about 1.5 miles from I-84), look for the Boise Astronomical Club sign on the right side of the road. There's a open gravel lot that we set telescopes up on.

One word of warning. When you pull in, turn your lights off (go to parking lights). Astronomers really hate it when you shine headlights into their eyes.

During my Albuquerque trip, I'll be presenting to the Albuquerque ARC. After I get back there's conferences in Salt Lake for amateur astronomers (end of July) and in Denver for digital radio (mid September).

Is anyone interested in going with me to present?

Don't forget, there's GPSL 2002 in Kansas. If anyone can make that one, please let me know.

Come out to the star party and see the new comet.

Paul

Hi Justin

I guess you noticed the stock rubber duckie for the KW HT cant hear :)
I would pick one that has an SMA connector. You will defeat your
purpose
of improved performance if you add an adapter between the radio and
new rubber duckie antenna. Also the extra adapter will put more strain
on the threaded connector on the radio.

I use Comet's SMA-24 17.5" rubber duckie. It has a very flexible
whip and a nice looking gold sma male threaded base. BIG improvement
in reception over the old one. I almost sent the radio back until
i changed antennas.

If you like Diamond, i would go with the SRH-519 8 incher because of
the
sma base. Have not used it,so it is my only choice out of the
Diamond line up for HT duckies. You might prefer the shorter lenth
over
the Comet's rather long whip.

You may want to buy a sma to bnc adapter anyway for other
mobile antennas later. I have a cute little mag mount antenna i
carry behind my pickup seat in case i need another antenna. It has a
very flexible coax (RG-172 i think)terminated in a male bnc end.
Would have preferred a sma end. However the small diameter coax puts
very little stress on the adapter. It has a cute little "hershey candy
kiss" size magnet. I laughed when i got it,but i dare anyone to try
and drive fast enought to blow it off the roof. I have loaned it to
more people than i have actually used it myself. Cant remember the
name of it right now.

Hope this helps. If you could show up at Sundays workshop, i could
bring the mentioned items and let you evaluate them. Nothing like
hands-on shopping before actually forking out the payola ;)

Standard color is good in my opinion. All great organizations
have a standard color scheme don't they? It give you that really
great geeky look :) Color mine Tan if we are voting.

Hey Randy,
Thanks for the info. I'm going to try and make it to the meeting this Sunday but not making any promises. I have three, rather large, mid-term tests this Monday and I have been studying since Wednesday. I will probably need a break sometime Sunday or I'm going to explode. I'm ordering a D7 from AES in Las Vegas this Monday (hoping it will get here before the balloon launch) and was going to order a replacement antenna along with it. It seems like most HT antennas (good ones with high gain) are terminated for BNC, and only a few SMA ones. I was able to get a new Garmin GPS now I need the other half (the radio) for APRS. Thanks for the help.

> Anybody know if "Project Traveler" is airborne?
>
> Harry - KC5TRB
> Tulsa. Ok

As of the time of this writing, 10:30 AM Kansas time,
I don't see the balloon on http://www.findu.com, but
there are recent packets from a "launch" station at the
right place near Hutchinson, Kansas, so I think there
might be a delay to cope with winds.

A scrub announcement may be forthcoming if it's just too
turbulent. The text from NWS tells just how wild a
night it was in the region. Reno county was real bad
and is the exact area of the balloon.

I'm in Massachusetts and don't have an official voice
in this, just a very interested observer.

Enter these rough coordinates into findu for
the launch site:

38.1 north -97.9 west

Hank

check HABLIC for upcoming amateur balloon launches
everywhere

http://www.geocities.com/n1ltv/hablic.htm
"All balloon launches, all the time"

==========

NATIONAL WEATHER SERVICE WICHITA KS
505 AM CST SAT MAR 9 2002

IT WAS A DARK AND STORMY NIGHT ACROSS EASTERN KANSAS. A VERY STRONG
COLD FRONT BLASTED THROUGH THE STATE...PRODUCING NUMEROUS REPORTS OF
SEVERE WEATHER. GOLFBALL SIZED HAIL FELL NEAR ARLINGTON IN RENO
COUNTY...WHICH WAS THE LARGEST HAIL REPORTED. 50 TO 60 MPH WINDS
WERE COMMON...WITH A 69 MPH WIND GUST REPORTED AT FORBES FIELD IN
TOPEKA...AND AN 87 MPH GUST AT WINFIELD IN COWLEY COUNTY.
SIGNIFICANT WIND DAMAGE WAS ALSO REPORTED IN SOUTHEAST KANSAS...
ROUGHLY ALONG HIGHWAY 169.

THE FRONT BROUGHT WINTER LIKE TEMPERATURES BACK TO THE SOUTHERN
SECTIONS OF KANSAS. PREDAWN TEMPERATURES RANGED FROM THE TEENS IN

THE NORTH...TO THE LOWER 20S SOUTHEAST. CLOUDS WERE EXITING THE STATE...BUT NORTHWEST WINDS WERE STILL GUSTING BETWEEN 30 AND 40 MPH.

THE FRONT WILL QUICKLY MOVE SOUTHEAST ACROSS ARKANSAS TODAY...WITH HIGH PRESSURE BUILDING IN ITS WAKE. WIND ADVISORIES ARE IN EFFECT TODAY FROM ARKANSAS TO IOWA...AS WELL AS EASTERN OKLAHOMA AND EASTERN NEBRASKA. WINTER WEATHER ADVISORIES ARE POSTED FOR A SMALL PART OF IOWA...WHERE SEVERAL INCHES OF SNOW AND BLOWING SNOW ARE FORECAST. SKIES ARE EXPECTED TO CLEAR OVER THE REMAINDER OF THE PLAINS BY TONIGHT.

That was supposed to be *9:30* Kansas time. Now at
around 10 AM CST the last packet reported from the
launch station is about 30 minutes old, and I don't
see the balloon itself, so that doesn't look too good
for a launch today.

Just speculating, though.

The "launch station packet" was an object transmitted by WA0JRJ-1, who may have been simply marking the launch site.

I'd be very impressed if Traveler did get off the ground today - my first reaction to seeing 18F and 30-kt winds on a scheduled launch morning would be to roll over and go back to sleep.

From: Zack Clobes
Topic: 2124 Message: 2127

Sorry in taking so much time in getting this out - we've been discussing the morning.

To sum it up, Project: Traveler didn't fly, however the balloon did.. :-/

We had a series of problems this morning that ended up with the 50lb fishing line snapping on launch, thereby letting the balloon go. The weather.com was reporting 28deg with 18mph winds which we decided we could launch in. It turns out with some post-mortem that the temp was actually somewhere between 15-18deg and the winds were up and down, but probably well above 18, especially on gusts. Our feeling was the everyone was up and ready to go, we might as well try it since it didn't look like the winds were dying down any throughout the day (they've gone down considerably as of 12pm).

Because of the cold we quickly filled the balloon and brought the transmitters online. We did have a couple of quirky things happen to our GPS - it stopped sending data just after power up and it had a heck of a time acquiring a lock. We rebooted everything, wiggled the cables, and got it out away from the vehicles and it then locked on just fine.

As we were getting ready to go, we did a final check on the knots on our rigging and found that both ends of the fishing line could come lose with very little effort. I cut them off and wrapped a little duct tape around for good measure and had a solid connection. After some strategizing of how to get everything into the air, we started letting out the line and there was enough of a snap on the line to break the fishing line (in the middle - the knots held). The bad news - we lost $130 worth of rubber and helium. The good news - the capsule is safe.

The fishing line appears to have gotten very brittle in the cold air. I don't totally understand this as I've been using the exact same line (same spool) as guy wires on my bugcatcher antenna on my vehicle for almost two years now without breaking. The second issue we will be addressing is why the GPS quit. I could hear the power inverter running in it, so it was getting power but the data didn't seem to come through for a minute or two.

Lastly, I'd like to solicit some discussion of launching procedures using lanyards. We have a delicate antenna on the bottom of the capsule so we couldn't use the lanyard off of the bottom of the box (like last time) but were wondering about putting a ring just a few inches below the balloon and let everything else hang. This concept probably would have saved our balloon this time and possible put less stress on the fishing line.

As for next time, we're looking at the schedule for mid-afternoon next weekend.

The "launch station packet" was an object transmitted by WA0JRJ-1, who may have been simply marking the launch site.

I'd be very impressed if Traveler did get off the ground today - my first reaction to seeing 18F and 30-kt winds on a scheduled launch morning would be to roll over and go back to sleep.

That was supposed to be *9:30* Kansas time. Now at
around 10 AM CST the last packet reported from the
launch station is about 30 minutes old, and I don't
see the balloon itself, so that doesn't look too good
for a launch today.

Just speculating, though.

Hank

2128. Lanyard procedure

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-09 18:32:58 UTC
From: Mark Conner
Topic: 2128 Message: 2128

Sorry to hear about the loss of the balloon and helium. Been there, done that, fortunately with a free 350g balloon but $60 helium. Our problem was we didn't secure the balloon to the filler hose well enough.

NSTAR has been using the lanyard procedure for launch since the start (it was developed under KNSP and has had a few refinements since). I use a 2.5" or 3" brass ring (available at craft stores) to run the lanyards through. After fill, we rotate the balloon to twist the neck (easier that way) and put the ring at the bottom of the fold when we fold the neck. If the ring is formed from bent wire, put the gap under the neck so the lanyards don't catch on it. Then we tie the neck off with the end of the load line and tape over the neck, leaving the ring open at the bottom of the works.

We use two lanyards to control the balloon. The lanyards are wound on common kite-string winders and have about 100 ft of line on them. The open ends are tied in a loop and the other ends are secured to the winders. The lanyards are both fed through the ring and the open end is held with the crescent wrench I use for the helium regulator (put the wrench through the loops).

If the winds are light, we form a triangle with the lanyards and raise the balloon until the payload is off the ground. If the winds are a bit stronger, all three tend to end up standing upwind of the balloon. When we're ready to launch, the person with the wrench simply releases the open strings and the balloon's ascent pulls the lanyards through the ring. This results in much less stress on the payload string.

Make sure you don't have an excessively long payload string with this method, or you'll have to have a lot of string for your lanyards.

That sounds very interesting and we will probably go with that method.

The next question is something you eluded to - what are the optimal lengths for the rigging and why? Do any particular lengths have any advantages?

2130. RE: [KNSP] Lanyard procedure

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-09 21:08:33 UTC
From: K7JPS - John
Topic: 2128 Message: 2130

Too bad about the balloon. Your description gave me flashbacks of TV01B. On that flight we were attempting a 9:30 launch to coincide with the start of astronomy day at a local museum. They had even provided some of the funding for the flight as I recall. We usually like to launch around sunrise because the desert winds are usually at a minimum then, but wanted the kids at mission control to see real-time SSTV and tracking.

As the balloon fill was nearing completion, the CC/PS entered flight mode and we noticed that the glider which was to be released at 75,000 ft dropped while that capsules were still on the launch assembly tower. Also, the 35mm camera had not yet started taking it's initial sequence of photos.

It was determined that the I/O cables for these two devices and been reversed. After a 10 - 15 minute delay to remove the styro-fill and swap ports, the launch continued. As I recall TVNSP has always used the lanyard procedure to launch balloons, I believe this came from Paul's days with KNSP. As the lanyards were being let out, a sucker wind picked up and caught the balloon handlers off-guard. This wind blew the balloon within a couple of feet of the sagebrush covered ground. Fortunately they reacted quickly enough to save it from a pre-launch burst, and were able to raise it to full launch height with the stack completely suspended.

The first lanyard was released and pulled free of the lanyard ring. As the second lanyard was released, the balloon began it's assent. When the lower capsule reached an elevation of 8 feet above terrain, the stack fell back to earth, with only the second lanyard and winder still attached to the balloon. The fellow who had been holding the winder had significant rope burns on his hands from trying to pull the lanyard through the ring.

After watching the balloon rise out of site, we examined the remnants of the load line and determined that the wind had twisted the balloon and caused the load line and lanyards to become entangled. Pulling on the lanyard caused the load line to sever.

We still feel that the lanyard procedure is the most effective way to have a controlled launch, but have added some precautions to the procedure. All handlers on the lanyards wear leather gloves, and someone is standing by with scissors or a knife to cut the lanyard if it snags. If all else fails, the the handler lets the winder go with the stack. This last procedure was evidenced in TV01H where the lanyard can be seen bobbing back and forth through the frame of the video camera - just Murphy's luck.

TVNSP uses a 1.5 inch metal ring to pass the lanyards through. The ring is first slid through a loop of sisal line that is then taped into the neck of the balloon as the balloon is sealed off. The load line is then tied (and now, taped to prevent abrasion) to the bottom of the ring. The rest of the

procedure is similar to Mark's description used by NSTAR.

Thanks for letting me ramble on, and reminisce. A more detailed though not complete description is available at:
http://www.the-one.com/tvnsp/filling.htm and

TVNSP uses a 1.5 inch metal ring to pass the lanyards through. The ring is first slid through a loop of sisal line that is then taped into the neck of the balloon as the balloon is sealed off. The load line is then tied (and now, taped to prevent abrasion) to the bottom of the ring. The rest of the procedure is similar to Mark's description used by NSTAR.
We also used to tie a ring separately, but then decided it was faster and more secure simply to put it in the "U" formed when the neck is folded over. We also took to tying the load line directly to the balloon after hearing of the eight-foot flight of TV01B. That way the lanyards can't abrade the load line at the point it's tied to the ring. If you do it this way, make sure to put the ring on the fill adapter before you tape the balloon on.

Perhaps Ralph will accept the video of TV01B for record low-altitude flight? :)

A question - is there any advantage to releasing the lanyards one at a time vs. simultaneously? We could never find a good reason for doing it one at a time.

To answer Zack's question about stack height - most of it is determined by the length of the line from balloon to top of parachute. During the KNSP flights we tended to use about 30 ft as a default. I started that way, but then it became difficult to winch out the balloon with such a long load line (the payloads couldn't come off the ground). I use between 15 and 20 ft now without a problem. If you use a longer load line, you'll need proportionally longer lanyards, by at least 2:1 (closer to 3:1). So if you're 40 ft from balloon neck to bottom payload, you need at least 120 ft on each lanyard.

I think the main thing is to make it long enough so that the balloon shards won't rest on the top of the parachute or become entangled with the shroud lines. Some times you get back 75% of the balloon and you don't want that resting on top of the chute and deforming or fouling it.

I've also found that long distances between the two capsules is not a good thing. I used to attach them 8-10 ft apart. Now I attach them within a couple of feet and at two tie points. This makes things much more stable on descent.

We also took to tying the load line directly to the balloon after hearing
of the eight-foot flight of TV01B. That way the lanyards can't abrade
the load line at the point it's tied to the ring. If you do it this way,
make sure to put the ring on the fill adapter before you tape the balloon on.

So you the load line running next to the ring?
I think that still runs the risk that the lanyards could twist on the
load line. The friction generated when the lanyard pulls free of the
balloon can still cut the load line. The balloon gets sucessfully
launched, but not the capsule.

>
> Perhaps Ralph will accept the video of TV01B for record low-altitude flight? :)

That's NOT funny!!!!!

> A question - is there any advantage to releasing the lanyards
one at a time vs. simultaneously? We could never find a good
reason for doing it one at a time.

I think it reduces the chances that the lines will tangle together.
I'm hoping to develop a release mechanism that cuts the lanyards
at the balloon, so there's no ring to pull the lines through. We've
had a lanyard jam on the ring. When that happens, you have to
give the lanyard a tug to pull it free.

Paul

Sorry to hear about the balloon loss. Look at it as another learning
experience instead of a failure. Did the line snap at a knot ?
Or did it just break fromm stretching?

Your experiment cleared any thoughts of me trying monofilament line
now.
My biggest concern was knot weakness and abrasion resistance. You can
not use just any "old knot" on fishing line. You must tie a knot that
secures the tag ends and double the loops to prevent making the line
weaker at the secured point. You generally loose 50% of you tensile
strength with only one wrap. I doubt UV breakdown was any problem
unless you used the line
many times before. Modern fishing lines have pretty good abrasion
reistance under water,but not in a non-lubricated enviroment above
water.
Friction of any kind is a bad thing.

I think i will stay with the braided lines if i ever get to launch.
Seems like "Murphy" never dies.
Good luck in the future.

Yes, it's next to the ring. So far (knock on latex), we haven't had one twist this way.
>
> Perhaps Ralph will accept the video of TV01B for record low-altitude flight? :)

That's NOT funny!!!!!
Then how come I was LMAO when I first saw the video clip? :-P It hurts to lose a balloon
and helium like that, but it sure is unique video.

> A question - is there any advantage to releasing the lanyards

at the balloon, so there's no ring to pull the lines through. We've
had a lanyard jam on the ring. When that happens, you have to
give the lanyard a tug to pull it free.
We've had one do that too, but wasn't much of a problem - it hung up only briefly. I think
it looped on itself.

I have always had better luck with a longer antenna performance wise.
Check the specs. of each manufacturer here. Some claim they get equal
performance out of a shorter antenna.

Physical considerations,you have to decide how you are going to carry
the HT. The longer antennas can get in you way sometimes. They brush
us against your back if you carry them on you belt or hip pocket.
Obstuct your view somewhat if you try to carry it in you shirt pocket.
This is all a personal preference.

I really think we almost learned more today than we did on the entire previous launch. We had discussed a mid-winter launch last summer and what it would involve an never imagined many of the problems we ran into today.

As for the breakage, it was rather unusual. The line was brand new off the spool. The spool is several years old but still seams to be in good condition. Just before releasing the balloon, we did our routine knot check and sure enough both of our knots broke on the monofilament. The thing is, that we didn't pull on them hardly at all. At this point we are theorizing that the line becomes brittle somewhere around 20F (sticking it in the freezer doesn't phase it). The knots just crumbled in our hand with probably 5lb of tension.

We re-did the knots (as best as we could under the conditions... i.e. plenty of duct tape) and let it go. Before the parachute was even off the ground, the line snapped between the knots. We pulled what was left of the string off the parachute tonight (at room temp) and couldn't find any signs of give or brittleness.

As for the knots - we don't take chances with any of them - ALWAYS USE EPOXY ON ALL KNOTS.

What we still don't understand is, assuming it is temp related, why aren't more people seeing premature breakage from monofilaments? We will be investigating Kevlar and other alternatives this week, but we are curious what others are doing and their experiences.

Thanks,
Zack Clobes, W0ZC

Attachments: 2 described; binary payloads are missing from this source WARC

I agree with Randy completely on all his points.

I've always seen better performance from longer antennas, assuming they are properly tuned to the frequency of use. My 19 inch whip clearly outperforms my 8 inch duck. On the other hand, I have an 8 inch after-market rubber duck that clearly outperforms the 8 inch "dummy load" "antenna" that was shipped with my Yaesu. I wish I could tell you the brand, but I bought it at Dayton from a booth that was selling both business band and ham hand duckies. The only visible difference is the color of the stripe around the top. I guess they figure business people are willing to pay more for a better performing 150 MHz HT antenna. It didn't take much for the commercial manufacturer to modify this design internally to work at 146 MHz. This antenna is also very rugged. There is obviously more material in my commercial antenna than my Yaesu dummy load. Don't get me wrong. I love my Yaesu radio and highly recommend Yaesu equipment and support, but they've had to jump into the same fox hole with everyone else to compete. They put their money in the radio, not the antenna, probably hoping you'll buy a better performing Yaesu antenna for a few extra bucks. But I think they know that when you're shopping for a radio the antenna is the last thing on your mind.

I guess I should point out that my Yaesu 8 inch rubber duck is a "dual band" "antenna" and my 8 inch commercial rubber duck is only a single band antenna, which probably avoids some design and performance compromises right off the bat.

Unless I have an idea coverage will be marginal, when I plan to carry my HT on my body I use my 8 inch commercial rubber duck. When I plan to use the radio in a vehicle, or a less confined area, or when I know the HT will mostly be in my hand and not on my belt - or when I suspect reception will be marginal, then I use my 19 inch Comet dual band duckie.

I have some suction cup and window clip accessories (even a hat clip come to think of it) that allow me to put either antenna on the end of a cable. We've had good luck using a suction cup to mount either antenna to the window (inside or outside works about the same) of private aircraft and rental cars. When mounted this way the 19 inch whip is more practical. Its too easy to break a 19 inch whip clipped to your belt, or worse yet, poke someone in eye.

Good luck,

Tony

Those of you coming in from out of town, try to avoid
the intersection of Fairview and Milwauke. The have
all lanes at the intersection down to one lane in each
direction. Go down Cole if you can.

Hmm..Some of the DUCT tapes out there use cheap glues that can attack plastics. Also have you checked the EPOXY and how it reacts with the monofilament? Also i have found that the cheaper fishing line brands have poor quality control. I had a el cheapo brand spool along time ago that had brittle spots in the entire spool.

If intent on using fishing line you might look into a line called "spider wire". I think it is kevlar based. About 1/2 the diameter
of equivalent mono. line if i remember correctly.

As far as the temperature thing,i have fished in freezing icey waters without any problems for steelhead using only 10 lb test. Have fought 18-20lb fish for 30 minutes without any failure.
Never had brittle line problems. Usually the ice formed on the eyelets sometimes caused abrasion problems. Or failure was usually due to my horsing the fish and exeeding the lb rating of the line.

Hey i can see another experiment here: How about fishing with a balloon
grappling line and a tensile strenth sensor attached.

Time for another "gas fix" to clear up this cabin fever ;)

From: Zack Clobes
Topic: 2124 Message: 2143

The duct tape wasn't put on until after the knots became brittle.

I will try some epoxy on a piece of line but the epoxy would have had to deteriorate the line one foot away from the original knot since we cut off the old knot and re-tied. This is also the exact same procedure we've successfully used on two other flights.

We have done some experimenting with the line since yesterday. Putting it in the freezer doesn't have any effect on it. However, yesterday we were in about 18-20F.

I don't think it was just a bad spot - both knots on each end of the line literally crumbled with very little effort. We have since tugged on the remains (under room temp) and have had no problems. We have also spooled off about 20' of line and applied pressure with zero faults.

The only other reasoning that we can come up with is possibly the parachute or some balloon remains that were on the parachute reacting with the line. Usually assembling the rigging is a last minute ordeal, however I got around to it about a week ago on this flight and stored the whole thing wrapped up around the parachute along with some nylon rope. I currently have a piece of monofilament wrapped around the parachute and will test it in a couple of days.

I plan on trying to come up with some Kevlar today and will probably use that in the future. Nonetheless, we're very interested in why we had this failure yesterday.

It certainly was unique. I guess I would have felt better if it had gotten at least high enough to let the parachute open.

We've made it a policy that we'll cut the lines if it looks like the lines are twisting.

> As for the breakage, it was rather unusual.

We use a twisted nylon line. I've seen that stuff break when the
wind tugs on the balloon. The sudden jerk is enough to break the
line. It happens around the knot, where the line was weakened by
the knot itself.

> As for the knots - we don't take chances with any of them - ALWAYS USE EPOXY ON ALL KNOTS.

Ummm, ya, that would work. But tape seems faster.
We tape our knots, just to be sure. We'll all a bunch of Boy Scout
drop outs, if you know what I mean.

Be sure to waer gloves. The thinner the line, the greater its cutting
ability.

That does it, we're going to steel cable.

As I understand, it was windy that morning.

Two of the balloon loses I had were due to wind pulling on the
balloon and snapping the line.

It was effective (to an extent) in WW II against German aircraft. I guess it was most useful against night attacks. If memory serves, they also knocked down some V-1s (buzz bombs) with barrage balloons.

We tested APRS last Sunday. I powered up a capsule and a
backup tracker. Those that were ready were able to see them.
We also worked a little bit on the on-board recorder (from Solutions
Squared).

We haven't done BS2 lessons. I hope to start them up again
before too long.

We also discussed the launch schedule and the Warhawk
Museum.

I was just working on that for a temperature sensor Sunday morning.
If you mean the DB-25 port:

For the AN0 input, Put J8 in position 2 The external voltage will be
read from pin #18

For the AN1 input, Put J10 in position 2 The external voltage will be
read
from pin #11

Use the ANALOG command to receive the string of eight values. Only
the first two values are relevant. There is a hack to get AN2,AN3 and
AN5 for 3 additional inputs if you need them.
Use the TELEMETRY n (where n=0-255)command to to send a beacon.
The beacon is sent every n*10 seconds.
if you need them.

From the manul so your smoke should not vary.

Thanks, that is what I was looking for. I take it that the hack for
the other ADCs is not documented? I'll do a serach over the
internet for it. Has anyone make the hack and had it work?

The hack is at the nwaprs.org site if i remember correctly.
If i get time,i will look it up for you later. At work
right now,so it may take some time.

Any time you have sudden jerks on a line the line is likely to break. In a previous life I used to do a fair amount of 4-wheel drive stuff. Never ever use cable or chain for pulling out a stuck vehicle. They break. Something with stretch to absorb the jerk is needed. Not only is it less likely to break but it can amplify your pulling force. A buddy of mine broke a 20,000lb test snatch strap. I bought the 30,000lb test one. I haven't broken it yet and I've pulled out vehicles that took several runs with the strap slack to start with.

Anyway, any line that doesn't have some stretch to it will break if it goes slack and then taught rapidly. Gusty conditions are likely to do that.

I'm puttng together my notes about TNCs. Jeff can you email what commands you programmed into your KPC 3+ before we launched it into near space?

I'd like to test the Kenwood Data Radio as a near space tracker. John, what commands do you need to program into your radio? Would you be willing to do a ground test of your Kenwood as a near sapce tracker? How about a near space test sometime with a backup tracker? Will the Kenwood transmit any data sent to it? I'm wondering if the CC/PS could format data and then hand it off to the Kenwood for transmission.

Jeff, will you be going with us on the March launch? Will we be sending your camcorder up?

You might want to contact the Montana group.
They use the KW HT in their launches. Might not
have to reinvent too much of the wheel.

The KW D7 can be run either in APRS mode or in packet mode. With the APRS mode all you need is the NEMA string from a GPS, the rest is defined in about 12 menu settings. For packet mode, it functions just as a TNC so that you can hook it up to any desired "computer" for TX/RX.

I would be happy to do some surface experiments with you on this.

By the way, my baby girl was born on Wednesday morning. She and Mom are doing great :)

Paul,

I will retreive the information from the KCP 3+ tomorrow and
send it to you.

I'm not yet sure if I can make the March flight. Are other
capsules ready yet? If other capsules are not ready and if I
can't make the flight then someone can borrow my gear.
How high is this flight expected to go?

Are the new flight prediction procedures in place yet? I
wouldn't want a repeat of our last flight.

Dan,

In addition to the official GPSL website that Ralph told
told you about, at HABLIC you'll find founder Paul Verhage's
detailed GPSL2002 announcement in plain text and MS Word
formats. GPS2002 looks like it will be a great event.

HABLIC tries to keep up with all the balloon launch notices,
and a website with a complete balloon project website list is
the AMSAT high altitude balloon web page:

http://www.amsat.org/amsat/balloons/balloon.htm

John,

Thanks. You didn't give any times.

Is there a launch location established yet for March 30?
Not necessarily the exact spot, but a town name.

Do you know if the payload callsigns and frequencies will
be the same as the last TVNSP launch.

The launch times are at dawn. The time will vary with
the time of year. The location of the launch may not
be determined until the meeting the night before. It
depends a lot on winds, etc. With having mountains on
the north and south side of the valley, we have to
watch wind direction very closely and be very flexible
in our launch locations. The last launch we tried
several different locations but moved because of wind.
We launched in a flat area about 100 yds. off the
highway.

2195. Oklahoma Space Planes site

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-20 00:28:06 UTC
From: Mark Conner
Topic: 2195 Message: 2195

Wayne KE6DZD pointed out this site to me:

http://www.okspaceplanes.com/

This reminds me of an experiment done by some high-school science teachers who visited Purdue for a summer class in meteorology in the
mid-80s. We filled 12" party balloons with helium and attached postcards in sealed bags with a streamer made from white plastic garbage bags to add visibility. The postcards were prepaid and printed with a return address and asked for the location where they were found. The emphasis was on cheap raw materials and something easy to replicate in a high-school classroom.

We used the winds reported from a nearby upper-air station to model where the balloons should go, and different ascent and descent rates and burst altitudes to provide predicted landing sites which we compared to where the balloons were found. As the undergrad research assistant, I got the task of writing up the BASIC program to do the interpolation of the wind data and then the prediction of the flight path.

I think we had about a 10% return rate, maybe less. About 200 were released and maybe 20 were eventually returned.

Sending up 500 planes is probably ambitious for one of our balloon flights - a full ream of paper is pretty heavy and 500 planes would have a lot of bulk. I think we could come up with a mechanism that would cut or release a loop of fishing line that would turn loose the planes at altitude. About 50 is reasonable, and would let a couple of classes participate in a flight. Using colored paper would help visibility too - somebody might actually pick up a flourescent pink paper airplane.

- Mark

2197. Next Project: Traveler Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-20 05:33:41 UTC
From: Zack Clobes
Topic: 2197 Message: 2197

We're already starting to look forward to our next launch, tentatively scheduled for Thursday 2 May. This launch will be part of our grade school tie-in that we have been working on throughout this school year.

If anyone is available to help track this launch, we could use at least one more chase vehicle to help out with chase and recovery. At this point we have two confirmed chase vehicles (quite possibly a third if we have enough people to stay at the school), but that is subject to change if we had to postpone the launch until Friday or the following week (we're mostly working folk down here).

The payload will be practically identical to last week's launch with APRS on 144.39 and ATV on 434.

Thanks,
Zack Clobes, W0ZC

From: Mike Garske
Topic: 2198 Message: 2198

Hello All,

I have spent the last two weeks trying to come up with a solution to a problem I have run into. My Laptop- an IBM ThinkPad 600E, has trouble with the inverter power from my vehicle. I wired up directly to the battery a 300 watt power inverter. I plug the laptop in and the mouse goes crazy when it boots up into Windows. When I power it in the house, it works fine.

I had a thought that the sine wave the inverter put out was not steady enough to give a "clean signal", so I got a UPS to run it though, thinking it might help clean up the 120V. It is a CyberPower 175 watt unit. Of course a new problem cropped up....the UPS thinks there is a ground problem being plugged into the inverter, and refuses to work.....UGH!

Short of pouring excessively more money into this project, any ideas to resolve this are welcome!

I have one more option, and that is to order a DC converter from IBM to run it in the truck ($80)....does that seem to be the only option I have?

Thanks for listening!

2200. Wiring the Alinco DJ-C1

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-21 17:23:10 UTC
From: Mark Conner
Topic: 2200 Message: 2200

I snagged the following from the "Ballooning" e-mail list at Yahoo. I couldn't find any photos of the inside of the DJ-C1, but this is good info for those who might use the Alinco radio for beacons, etc.

- Mark

Message: 1
Date: Wed, 20 Mar 2002 16:29:40 -0700
From: Mike Manes <manes@...>
Subject: Re: EOSS tech questions

Dr. Ebinuma,

Thank you for your inquiry.

EOSS uses the Alinco DJ-C1 2m credit card tranceivers for APRS and beacons, not the DJ-C5. The DJ-C1 antenna circuit includes a matching network between the 50-ohm RF xmit/recv port and the supplied short whip antenna. But there is also an internal 3-pin SIL connector with a jumper which provides access to the 50-ohm port. I suspect that this is used for testing using conventional 50-ohm equipment.

Note that simply connecting a 50-ohm antenna feed to the point where the whip connects will NOT yield specified performance; on the DJ-C1, xmit power to 50 ohms is less than 10 mW.

I hardwired a length of RG-174 coax to that connector to feed a larger and more effective external antenna. Full spec power and rcvr performance in a 50-ohm system appears on that coax. The coax was fed out of the DJ-CI housing thru the hole where the whip was fitted.

EOSS does have a DJ-C5, but it has not yet been modified for flight; I have it open on the desk as we speak. If you remove the rear cover, you will NOT find the 3-pin 0.1" SIL that is used on the DJ-C1. However, there is a very small SMT coax connector in the lower righthand corner which I suspect serves the same test purpose. Comparing its dimensions to those in the Pasternack Enterprises catalog, I think that it may be a standard type SSMB jack.

Unfortunately, I don't have a mating SSMB plug to verify this.

Immediately to the right of that connector, I see what appears to be a manually-applied solder bridge on the trace feeding the center pin of the coax connector; this may serve as the matching network disconnect. Thus by opening this bridge, it may be possible to get

full spec 50-ohm performance at the coax connector.

A mating SSMB connector may be difficult to find, and even more difficult to terminate on flexible coax, even RG-174. If so, then I would recommend that you simply solder-tack the coax to the ground and center pin traces on the PWB.

It may also be useful to know that the DJ-C1 operates quite nicely from +5 Vdc in lieu of the internal Li-ion battery. You may find the same true for the DJ-C5; this allows for much longer operational life than the internal battery can supply (2.5 hr of xmit).

I have taken the liberty of posting this response to a couple of other amateur balloon group reflectors in hopes that someone else has successfully inplemented the modifications that you seek.

Incidentally, is your balloon program operated under the Space Grant College program? If so, perhaps we can meet during the 20 April EOSS flight planned in conjunction with the workshop at CU that week.

Best regards, and good luck with your flights!

Mike Manes W5VSI
Pres. EOSS

Mike,

You might check out CompUSA and similar places, or online, for a Targus (www.targus.com <http://www.targus.com>) adapter. I have a Universal AC Adapter that includes several power tips and it lists the IBM 600 as supported. I kow they also have cigarette lighter adapters, so that might work. Definitely cheaper than the stock adapter for the AC adapter, so I'd assume the lighter adapter would similarly be less than that $80. (IBM is expensive, I know!) Another option might be to check out the IGo (www.igo.com <http://www.igo.com>) web site, see what they have.

If you're willing to try the AC Adapter, this one was about $45 when I got it, but it covers IBM, Toshiba, Compaq units, has built-in Surge Protection and voltage control to match your notebook.

Why do you want to run it through an inverter? Is this not a laptop?

How many volts DC does it need?

So.. I probably shouldn't admit this.. but I've run laptops
that require anything from 9-18 Volts DC straight out
of the cigarette lighter and haven't caught anything on fire
yet......

Just open it up enough to see if it has some kind of voltage
regulation circuit... and if it does, verify it has some
method of heat dissipation....

Just get the polarity right :) or you'll be tearing the thing
apart looking for a diode :) :)
Dave

Hmm. My Toshiba wants 18V from the AC adapter - I suppose that's to provide headroom for charging the 10.8V battery. Dunno what would happen if I fed it only 12V or 13.8V and am too chicken to find out.

I have two different inverters that I use - a 140W one and a 300W one. Both work fine with my laptop.

Since Mike's UPS and laptop both don't like his inverter, I wonder if the problem lies with the inverter. Mike, can you borrow a different inverter to try to see if you have better luck? Inverters are generally cheaper than other DC converters and have more uses.

You only need voltage that is about 1 volt higher than the
desired regulated voltage... pick up a voltage regulator
that puts out 10.5 to 11 volts and use the cigarette lighter!
:)

Works out nicely.. I imagine from the car you'd get 12.4 to 13.8 volts
just regulate it to 10.8V

:) DC to DC much nicer than DC to AC to DC :)

Just my 2bits worth. :)

Topic: 2198 Message: 2205

Thanks for all the suggestions everyone, I am probably going to look for the DC converter for the cigarette lighter power point I have in my truck.....and just for good measure I am probably going to buy a new battery for it.....the Lithium Ion that came with it when I bought it used is completely shot......That should cover my bases in time for the next launch!

By the way, this is the second inverter I have tried with the laptop, but the first with the UPS combo.

Bill (KC7JSD), What are your hours on Monday or Tuesday? I would still be curious if that AC adapter you have would work....let me know!

Thanks again!

Mike KC7DPD

Subject: RE: RE: [tvnsp] Vehicle/Laptop Power Problems

You only need voltage that is about 1 volt higher than the
desired regulated voltage... pick up a voltage regulator
that puts out 10.5 to 11 volts and use the cigarette lighter!
:)

Works out nicely.. I imagine from the car you'd get 12.4 to 13.8 volts
just regulate it to 10.8V

:) DC to DC much nicer than DC to AC to DC :)

Just my 2bits worth. :)

Hmm. My Toshiba wants 18V from the AC adapter - I suppose that's to
provide headroom for charging the 10.8V battery. Dunno what would
happen if I fed it only 12V or 13.8V and am too chicken to find out.

I have two different inverters that I use - a 140W one and a 300W one.
Both work fine with my laptop.

Since Mike's UPS and laptop both don't like his inverter, I wonder if
the problem lies with the inverter. Mike, can you borrow a different
inverter to try to see if you have better luck? Inverters are
generally cheaper than other DC converters and have more uses.

We've run an old Winbook directly off of a 12V battery. It always shows the battery status as being about half scale, but other than that it works perfectly. I definitely wouldn't leave it plugged in while starting the car though (lots of voltages spikes from the starter.. but I've never seen them damage anything).

You want to be a little careful about running 'em directly if you have them plugged into other gear powered from the same source. Some laptops (especially HP Omnibooks) use positive ground and it can create a ground loop that will fry your serial port.

If it were me I would at the very least hook just the laptop to the 12V source and measure the voltage between the chassis and the negative side of the battery. If it's anything other than zero you need some type of isolation. I'd also suggest measuring the voltage on the data ground. (Pin 7 on a DB25 - don't remember on a DB9)

Note: If frame ground is your only problem you MIGHT be able to get away with it if you are sure that your RS232 cable is properly built. Frame ground in an RS232 cable is only supposed to be connected on one end. Unfortunately, many are connected on both. Worse yet, some connect frame ground to the data ground.

Bill

This is for Mike: Just what does the IBM need for voltage(s)
and current(s)?

Have you thought of making your own adapter circuit?

From: n1ltv
Topic: 2209 Message: 2209

I spoke today with Natalie Vollrath of JPAerospace.
She's a very new ham, but this is what she has for us
so far. It's got to be APRS, but it's not the usual
144.39 if this information is accurate.

Hank

So far, the winds for the flight tomorrow aren't
looking very promising at the moment, and they predict
snow for Sunday. We'll still be here at 4am tomorrow
to prep, hoping for the best. Estimated launch time is
6:30am Central. The frequency of the beacon we are
flying is 145.390

Hank
Can you enlighten us what they are doing with this frequency.
I have not followed this group. Guess i am in the dark.
Just wondering since this is a repeater frequency. One of our club
repeaters happens to be on this frequency (145.390)

Well, back from Albuquerque. That added another 2850 miles to the car. Hope to have nice pictures to show.

I met with seven balloon people at the conference, which wasn't as well attended as they expected. I also visited the One Stop Satellite Solutions out of Weber State. They may give a presentation at the GPSL 2002 symposium. When we get together on Friday, I need to bounce a cubesat idea off of everyone.

Looking at the MRF, winds are predicted to be favorable for a Saturday launch. The jet stream will be north of us, with winds from the east, northeast. Low's should be around 45 and highs around 75.

After talking to Dr. Bird at the conference, I think we'll try formalizing the preflight dinner a little more. Dr. Bird's satellite engineering class had a problem with people making last minute changes to the capsules the night before a launch. So he held a Flight Readiness Review (FRR) the night before launch. At that time the capsule design was fixed, with no more changes allowed. I'm thinking we may incorporate that into our Friday dinners and include the final flight prediction, nominal driving routes, chase teams, etc.

Inputs?

Paul

Welcome back. It was getting a little boring around here without
the great balloon guru.

I like the idea of the (FRR). I felt we were a little to lax in our
prepartation plans sometimes. I know its a hobby, but there are some
expensive toys being launched. None of them are mine yet,but i know i
would have a thorough check of all hardware and software being used
for
launch.

All chase crews need to be just as prepared as the flight systems.
It dont do no good to fly if you can't recover. We can talk about all
this at the meeting. Can't wait for the first flight now.

"Idaho mountains,mud and snow,here we come" ;)

PS, chase crews should update their SA+ to version 2.00 or newer(2.09
being the newest). It has a new feature that could be useful if
(heaven forbid) we loose signal. Also it is easier to help each other
if we all have the same sheet of music to work from. Besides,the newer
versions are smoother running on older laptop systems.

2216. TV02A Pre-Launch Dinner / Flight Readiness Review

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-27 04:05:35 UTC
From: K7JPS - John
Topic: 2216 Message: 2216

I have reserved the Jade Garden Banquet Facilities for 6 pm Friday Night it is listed under my name and TVNSP. The address is 1514 Caldwell Blvd. Nampa. This is just east of Karcher Rd, across from the Karcher Mall. We will use 147.240 as the talk-in Freq.

Driving directions from Ontario. Take the Flying J exit #29 and turn right. Make a left on 21st street and go to the second stop light. Make a left on Cleveland Blvd (which becomes Caldwell Blvd) and go 5.5 miles to the Jade Garden. It will be on your left.

Driving directions from Boise. Take the Sugar Beet exit #35 and turn left. Take Nampa Blvd. to Caldwell Blvd. and make a right. Go 1.75 miles to the Jade Garden. It will be on your right. ** A NOTE for those who usually take Karcher Rd. to the Blvd. Karcher is closed from Midland to the Blvd for road work. **

Paul, I would like some more details on the manifest so that I can get the checklist updated for this flight. Also, could I have the particulars on the balloon envelope we are using this time, so that I can try my hand at LiftWin. I believe it is a 1200g balloon and that we are expecting a burst of 85,000 ft. I am using 1000 fpm assent and 1200 fpm decent.

My wife's car lost 3rd gear last weekend in McCall while we were on vacation... she lives in Pullman WA.... so I've been spending all my free time this week checking it out (The car is worth 2100 to 3300 and the transmission will cost 1900 to fix). So I've bought her a new car.... and now I have to drive it up there this weekend.

I'm bummed out, I totally had the 30th locked out on my calendar... Now my truck (with all my radio gear/APRS etc) is with my wife....

Catch you guys on the next one I guess :)

Dave

John,

There is a slight inconsistency in LIFTWIN which needs to
be fixed. According to Murphy's Law, it only affects the
1000 and 1200 gram balloons, the most popular sizes.

LIFTWIN matches Kaymont characteristics for those ballons,
but those characteristics that have been revised by Kaymont.
The end result is that for the 1000g and 1200g sizes the
altitude is a little low.

The early start to this balloon season has caught me off
guard with a corrected LIFTWIN, but I have a corrected copy
already working so I can get you the right max. altitude.

Even better I'll email you a corrected LIFTWIN that may not
be suitable for wide distribution, but will be okay in a pinch
for this launch.

All LIFTWIN results are correct on all sizes except
1000g and 1200g, and for those sizes all results are
correct except max altitude and those which depend in turn
on max altitude, like time to burst.

For an idea of the size of the difference, if LIFTWIN says 85K
for a 1000g or 1200g, it's more like 95K feet.

Hank

From: John Knapp
Topic: 2213 Message: 2222

When did 2.09 come out. I was out there yesterday and
the newest version I saw was 2.07. And I am having
problems getting it installed, will work on it this
evening.

Paul, I agree with you on the Friday night meeting.
Chase and recovery is as important as launch. So far
our chase was been fair, but it is nice to be able to
have things as organized as possible. I have not been
able to check the MRF yet, will do so as soon as I
can.

Doug put some money in the account. Doug can you confirm this?

By the way, I made a sale in Albuquerque. We have another $2.50
in the account. I'll drop it off at the next VOI meeting.

Umm, I need to ask if we got the balloon yet. Doug, do you have
the balloon?

The manifest for TV02A is as follows

Geiger Counter Telescope (nothing to turn on, other than the main
power switches)
Digital Camera on scan platform (open camera, switch is on the
back)

Inside the capsule we need to turn on the GPS

There are three switches on the capsule, main power, HT, and
servo.

There is a backup beacon on the parachute. We'll need to turn on
the GPS and HT. There are two additional switches, one for the
Tiny Trak and the other for the audio beacon. I recommend we turn
on the audio baecon last.

Jeff, are we carrying you camcorder up?

2225. (Fwd) ATVQ Spring issue

Yahoo group: tvnsp (2000 — 2002)

From: verhap@occ1.sd01.k12.id.us
Topic: 2225 Message: 2225

I got this message from Gene. I'm forwarding it to the group in an effort to increase the level of shame amongst Team TVNSP. Remember my request that we write articles for ATVQ about how to operate a near space program? Well the sacred cows have come home to roost and it's time we send Gene the next installment. By the way, I had a very nice dinner last night at the Outback Steakhouse courtesy of my payment from ATVQ.

Professional behavior won't let me say who offered to write up an article, but his name did begin with the word, "Mike".

On a more serious side.....
Does anyone have an article they'd like to submit? Can you have one ready ASAP? If the article is at least two pages long (and this includes diagrams and photos), Gene will pay $25 for the article.

Paul "Don't make me buy another steak dinner" Verhage

From: verhap@occ1.sd01.k12.id.us
Topic: 2226 Message: 2226

They're waxing floors tomorrow, so I can't come to the office to check email. If you need to contact me today or Thursday, please call my cell. 631-7162.

Another request for ATVQ articles. I know that barbeque chicken and ribs dinner I enjoyed last night wasn't the healthiest meal I've enjoyed. So please spare me the increased risks to my health and write an article.

The article I sent to Gene was just an overview. We need to send articles on specific topics. We want to cover the procedures required to launch a near space flight in enough detail that other groups can try to launch one of their own.

Paul

2227. Launch priorities

Yahoo group: tvnsp (2000 — 2002)

My own opinion is that there are bigger priorities with
the TVNS itself than with ATV magazine.

The TVNSP website could much more current material, and the more
formal launch procedures and landing predictions recently
adopted are rendered less useful if the composition of the
payload and its weight are still up in the air just a few days
to launch, not to mention what size balloon is being used.

I probably won't be able to update the pages during break.

However we should have a 1200 gram balloon. The payload weight
will be around 12 pounds. Add an additional 1.5 pounds for the
parachute. The backup beacon will be a part of the recovery
system, so add another 1 pound for it.

2229. Re: [tvnsp] Launch priorities

> The TVNSP website could use much more current material

"use" was left out before.

The flight's composition should be decided and disseminated
at least a week before a launch so that items such as path
projections can be *brought* to a flight-readiness review.

Without those items being prepared beforehand, the FRR is
really not much use.

John

Version 2.09 came out last week. Your v. 2.07 is close enough to
for our purposes. The menu and tab layout of the programs are the
same. I just thought it would be nice if everyone got past the old
V199 series which i recall some members still had from last season.
It just makes it easier to help a fellow chase crew member when they
ask "What button or tab do i click to get the latest report from the
balloon".
Im exagerating of course, but you get my drift.

I'm the type that likes to have the latest and greatest
updates,especially if
i paid good money for it. I also always keep the last good working
copy in case
the newest one bugs out. Always good to have backup software along
with the hardware.

If you want the newest version,just update your old one with the
GPS209.zip
and one patch file Patches.P209. If you have problems,i can bring
laptop
to dinner and help. Or call me on the land line anytime.

I've sent John by email a LIFTWIN that works correctly
with 1200 gram balloons. It's a version that hasn't been
checked out for general distribution or I'd send it to
the list and have it on the web.

Had a failure of a brand new HD that has hampered efforts
to get this straightened out.

Umm, I need to ask if we got the balloon yet. Doug, do you have
the balloon?

The manifest for TV02A is as follows

Geiger Counter Telescope (nothing to turn on, other than the main
power switches)
Digital Camera on scan platform (open camera, switch is on the
back)

Inside the capsule we need to turn on the GPS

There are three switches on the capsule, main power, HT, and
servo.

There is a backup beacon on the parachute. We'll need to turn on
the GPS and HT. There are two additional switches, one for the
Tiny Trak and the other for the audio beacon. I recommend we turn
on the audio baecon last.

Jeff, are we carrying you camcorder up?

This is about as bad as an "I told you so," except it's a "he
told you so."

Zack described on this list the EXACT scenario of the second
guy taking the order, and the possibility of a bad outcome
which uinfortunately has come to pass.

Thanks, Zack, for letting us know that this can happen more
than once at Kaymont.

This mornings Boise Observations had 12 lines in it, so I am using last nights observations. I came up with a flight of 97 minutes at 123 degrees. Duration is 120 minutes. I haven't had time to do the complete computations for all the blanks on the form.

Yeah I've been sitting here snickering.. :-) I don't know what your options are - I just called them a little bit ago and the funny guy acted like the normal guy wasn't there (I was inquiring about a different project).

Good luck.
Zack

Looks like we should consider having a backup balloon
in inventory at all times. Kinda ruins the idea of JIT
(Just In Time) inventory. Tough on the cash flow too.

Sheesh,ya can't count on anybody under 30 anymore ;-)

Everyone,

Well, looks like the launch scheduled for this weekend is in a real possibility of being canceled.....the reason, you ask? NO BALLOON! Unless it shows up today or tomorrow (it was ordered March 1st), then we are not flying on Saturday. Paul has called Kaymont, but could only leave a message, so far.

In talking to Paul on the phone, since he can't check his email today, he still wants to hold the "Pre-flight" dinner at the Jade Garden, just to discuss procedures, if not planning for the next days launch.
How about everyone email their intentions, whether or not to have the dinner Friday?

Like Randy said, we should probably consider having a "spare" balloon on hand for this kind of issue from now on, although this could cost extra on our part.

......And Saturday's weather was looking to be really nice over the Treasure Valley too!

If Kaymont can't be relied upon, and it looks like this is more common than not, perhaps another supplier should be considered. Surely they can't be so busy that they can't send ONE balloon in THREE weeks. Just looks like very poor business practice, IMHO....

Mike, thanks for keeping Paul in the loop on this today since they wont let him walk on the waxed floors at work.

My thoughts on dinner are, let's go ahead with it for the procedures discussion. I'd also like to go over the checklist. Looks like Saturday morning will give some of us time to write articles.

Go or no go, I will still be at the Jade Garden. We
may have a late balloon arrival so I believe we still
to proceed as we are still a go. A decision can be
made at the last minute.

Thanks for the update Mike.

I would really hate to see a "no go" flight this weekend. For my spring break, I had two choices on how to spend it. On one hand Lake Havasu, AZ and the other, TV01A. I opted for the balloon launch, but if nothing happens, I would hate to think that I wasted 9 days of warm sun, fast boats and college chicks in bikini's in AZ!!! Sounds like many other members took time off the see this thing through. I will be at Jade Garden on Friday night, and in the mean-time, crossing my fingers and toes for the arrivel of our balloon. I also agree with Randy about having a spare balloon. Maybe it can be a discussion topic Friday night.

I had a similar experience with Kaymont some time ago. If you call Kaymont to place an order, make sure you're talking to Paul. I think he's *the* sales guy. An order I left with someone else about a year and a half ago never made it to Paul and thus never to UPS and to me. Dunno why, but there's a serious disconnect between the others who answer the phone and getting orders in their system for shipment.

UPS says ground shipment takes 5 business days from NY to ID. If you don't see your Kaymont order after 7 business days, it's worth a call to make sure the order is in.

I take two balloons to each launch and actually have four on hand now. I like to keep a variety of sizes so that I can make a change to a new size at the last minute if I want. More up-front cost, but you'll use them eventually. :)

That was not intended for the list, but this is what it
was about.

I was thinking that some of these parcel services do not
do Saturday, even by request. FEDEX is one that does do
Saturday as an option.

Too bad it's too late for two day FEDEX, because that would
not be too bad for pricing. A 4 pound 6 inch cube package
ships two days FEDEX, KS to ID, for around $13.50. That
would get it to Idaho in time for a Sunday launch if it could
have left today.

Overnight FEDEX is more than double that amount.

Hank

Just remembered I have a 1200 balloon that we used to test parachutes. It has been inflated once. If you think it will work, you can have it.

Try this again, I hit the wrong key and off it went,
even though I wasn't done with this. Gotta love
computers.

Direction: 134 degrees
Distance: 112 miles
Time: 137 minutes

MRF was winds from the northwest to the southeast,
looks like they are mildly strong. Weather Channel
forcast as winds as the following:

6:00am - southeast at 3mph
7:00am - southeast at 2 mph

Temperatures are suppose to be 36 degrees, but may be
close to freezing in the desert, depending on where we
launch. Does freezing temperatures that have an impact
on the launch?

Anyone else do the predictions?

Recommend using the Eta or AVN models when you're within 48-72 hours of launch. The MRF has a grid spacing of 191 km and fairly long time steps. It's used mainly to forecast 3-15 days out.

The AVN also has 191 km grids, but is better suited for shorter-range forecasting. The Eta has a 40 km grid and more detail in the vertical than either the MRF or AVN. The AVN and Eta are also updated 4x per day.

I've found that the Eta over-forecasts wind speeds a little bit, and the AVN underdoes it a little, esp. near jet streams.

Assume an average of 134 degrees and a distance of 98 miles. If launched from Caldwell it would land approximately 22 miles south of Glens Ferry. Am not sure of the terrain down there.

www.topozone.com <http://www.topozone.com>

specifically

http://www.topozone.com/map.asp?z=11
<http://www.topozone.com/map.asp?z=11&n=4718345&e=638576&s=200&size=m>
&n=4718345&e=638576&s=200&size=m
From what I can see, that is dangerously close to an aircraft range
and just a little south of Bruneau Dunes....

Wait for it to load completely, the red cross in the middle is about 22
miles south of Glenns Ferry ID. At the very top right corner, you'll
see the corner of the air force range.... click up there to recenter the
map.

Lots of roads out there, easy country on foot (unless your in sand)...

John,

I just ran it using a 95k burst height and got 102.3 miles, 133 degrees. If we launched from Kuna like we did last year, it would land near Buhl. Lots of open BLM land down there.....

It is definitely a SE track the whole way, it might just pay to send a chase vehicle ahead? We will have to discuss this tonight at dinner.

Did anyone talk to Doug about the extra 1200g balloon he has right now? It had be used for the parachute tests last year....could we use it for a launch tommorrow?

2266. Saturday Flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-29 21:17:36 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2238 Message: 2266

I was thinking we'd cancel the Saturday launch. However, since the interest is so high and Doug did offer his used balloon, perhaps we should still launch.

There will be no camcorder on this flight, so we're looking at a lighter capsule. Run predictions with a burst around 90-95 k feet. I'll try to get a second capsule together to carry a few t-shirts and patches. I need to get some batteries for the servos and the digital camera. We'll also have to hook up the backup tracker to the parachute, but that can be done tonight.

Doug, how do we get the balloon from you? Mike, do you have the helium?

See you at 6:00

Paul

Just a thought. If the predictions are accurate, and I
believe they are fairly close, and the balloon goes to
95,000ft, and we launch from Kuna, the landing site
will be in the Roseworth area, south of Buhl-Twin
Falls. Don't know about the roads in that area but it
will take us a min. of three hours to get there. The
flight is two hours.

If we launch, we had better have a crew heading that
direction about an hour prior to the launch.

2279. Flight Logs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-30 20:35:01 UTC
From: Tony Barrett
Topic: 2279 Message: 2279

Hello everyone,

I've pasted copies of my flight logs below.

The details that are not readily apparent to me are the time stamps. On the -1 machine, I only got 15 reports, and the first 14 came in between 7:00:50 and 7:18:?? (56?) MST, with the 15th and last arriving at 8:06:25. On the -11 machine, I got 343 reports between 7:00:33 and 7:37:15 MST.

Hope this helps.

Tony

2280. TV02A Analysis

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-30 22:22:15 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2280 Message: 2280

It was an outstanding launch. We accomplished it in only about 30 minutes. Justin, I hope things work out about your car.

So far, looking at Tony's log (which is the most complete I have seen), I can tell the command module did not reset itself. There is no apparent GPS failure because the flight computer would have announced it. If the BS2p does not recieve data from the GPS, it goes into a GPS error routine.

The telemetry records from the MIM (which do not depend on the BS2p) did not reset themselves either. There is some flucuation in voltage values. I'll look up my documentation and determine which voltages changed significantly.

Most data from the command module was not recieved. I know there was some information on pictures being taken, but these messages do not show up in Tony's log. I'll need to look at someone elses log. Tony, can you send me your entire log? You probably have the data, they will appear after the GGL sentence.

The Tiny Trak sent out only a few posits. There's no apparent source of error.

I wonder if the radios failed or interfered with each other.

Paul

2281. TV02A pt 2

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-30 22:25:57 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2281 Message: 2281

John, we need to make updated predictions for the landing site.
Let's run them from 77,000 feet to 90,000 feet.

Jeff, can we ask your ultralight pilot friends about searching the
predicting landing site?

I have a Vertex HT at home along with a KPC 3+. I'm going to set
up a new tracker using them along with an Etrex and BS2p. I'll try
having the Etrex send data to the BS2p which will then send data
to the KPC.

Mark, on your flight computer, have you installed the MIM? If not,
which TNC are you using?

For the next flight, I'd like to try a tethered one. We'll hoist the
entire stack up and let it hang there for a couple of hours.

Paul

2286. Re: [tvnsp] TV02A pt 2

Yahoo group: tvnsp (2000 — 2002)

Topic: 2281 Message: 2286

I'm taking it that the capsule didn't make it home?

As for the condensation theory - we ran into condensation on our first flight last year. The capsule came back down through a rain cloud at about 8,000' and started making funny noises before it went silent. We seemed to be able to track the culprit down to the controller board itself - it was an unprotected home-grown board. We could cool it with circuit coolant on the bench and has the frost thawed, we got the same result as those we heard in the air. Since then we coat our controller boards very generously with conformal coating (I believe that's what it's called). It has sort of a sweet smell when wet/fresh. It leaves the board with a slightly glossy finish.

In our case though, we got lucky. It almost seems like the impact with the ground knocked the condensation off of the board enough for it to come back to life and we were only about 3 miles away from it. We've never seem condensation affect commercially built equipment (which is normally treated) even though I'm sure we're operating it out of spec (100% condensing humidity).

On our second flight which was coated, we recovered the capsule within a few minutes of touchdown and I've got a pretty good picture of the water droplets on the controller board/equipment - it was still running.

One other piece of wisdom which I picked up from a friend of a friend of a friend. Never use the gray peanuts that dissolve in water. I understand the Wichita, KS group lost track of a capsule (this may have been pre-GPS days... I'm not sure). When they finally did recover the capsule, there were some circuit boards in the bottom of a Styrofoam box with sticky white goop all over them.. :-)

Just to help fill me in - what exactly was the flight configuration as far as separate capsules/systems?
Thanks,
Zack Clobes, W0ZC

2288. TinyTrak II and tape review

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-31 00:45:50 UTC
From: Mark Conner
Topic: 2288 Message: 2288

The TinyTrak II will lock up if it gets too much RF into it. The transmitter will stay keyed on until the power is cut to the board. That's what happened to me earlier in the week, causing me to change the antennas around.

I had problems today with VHF RF getting into the camcorder - it would tear up the recording when it was keyed on. The UHF transmitter can also be heard in the tape audio as a buzz, but it doesn't affect the picture.

I just reviewed the video tape. The tape recorded for about 1 hr 40 min again - probably the batteries dropped out. It's possible that the cooling on descent is causing a problem too - will check the thermochron later. Other than the VHF backup beacon hammering the recorder every 30 seconds, the tape looks fairly good. One problem is that I did not override the autofocus when I turned on the camera, so it had some problems finding a sharp target to focus on at times; otherwise, not bad.

My thoughts are that a less expensive alternative to a tethered flight would be to simply run the flight ready equipment in a vehicle mobile until failure. You could throw a trip to Bogus in for altitude testing and running it until failure would give us some real life run time estimates for the batteries.....or we can keep flying unproven hardware.

I have not used the MIM on my flights at all. I'm using a KPC-3 v6.0 for the TNC.

I have a full log from the Internet feed, which should include all the traffic from KD4STH-* that made it to an I-gate. I'll grep out the calls and forward it if interested.

I hang my capsules from a tree branch while testing all transmitters together. I would guess someone has a 30' tower that would let you place a horizontal stand-off with a pulley on it to hoist the capsule up a little further.

As for the test estimates - keep in mind that temperature affect battery life as much as anything - putting them in the freezer will give you a pretty good indication of actual time.

Speaking of batteries, what type of battery does TVNSP fly?

2298. post flight landing spot estimates

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-31 05:15:45 UTC
From: Hank Riley
Topic: 2281 Message: 2298

From the TVNSP list late Friday:

Launch site: Adrian, OR N 43.73 W 117.06

I suggest using an ascent speed of 1140 feet per minute,
because that's the average from 3k feet to 77k feet.
I'll get the altitude in a minute, although if you use 1000 feet
you probably won't be far enough off to make much of a difference.

I'm going to be doing this prediction work for a few more hours.

The sounding from U Wyoming don't seem to go higher than 100
millibars for Boise and several other stations for Saturday,
12 UTC which is unfortunate.

I'm using a composite wind file and then modifying it to
conform to the reported 77k foot balloon position.

The 2300 came from an electronic topo map here on
my PC for the launch location in Adrian.

For further confirmation here's the USGS listing
for the town of Adrian; altitude is usually taken
at town hall.

Feature Name: Adrian
Elevation: 2228
Estimated Population (1994): 136
State: Oregon
County: Malheur
Variant Name(s) Riverview
USGS 7.5' x 7.5' Map: Adrian
Latitude: 43 44 27N
Longitude: 117 04 15W

TopoUSA was showing 2238 feet. (Note I've only got the USA version.
Eventually I'll get the more detailed ones.)

I'm not sure I've seen the earlier predictions on the list. (though it
looks like some messages may not be getting to me...)

Prediction using 77k burst altitude = N 42.8796 W 115.8098
Prediction using 85k burst altitude = N 42.8498 W 115.7459

Both are a little over 2500 feet in altitude according to TopoUSA.

2304. TV02A Ground Photo Analysis

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-31 11:11:33 UTC
From: Mike Garske
Topic: 2304 Message: 2304
Attachments: 1 described; binary payloads are missing from this source WARC

Group,

Just thought I would share a photo that might bolster the theory sent out about the TinyTrak getting too much RF into it and shutting down. I took pictures of the stack before launch and noticed something that we might have caught on the ground. I saw that the backup beacon antenna was on the same side as the other main antenna. It is also not supported by any thing to keep it from wrapping itself around the other antenna and causing havoc. Could this have been a likely cause?

Dan, KD7MVO, do you have any pictures of the stack that might show this?

Mike KC7DPD

2305. TVNSP landing spot estimate maps

Yahoo group: tvnsp (2000 — 2002)

From: Hank Riley
Topic: 2305 Message: 2305
Attachments: 3 described; binary payloads are missing from this source WARC

This is what I could come up with in the last few hours. I
tried to download a newer version of the Balltrack which does
some of this automatically, but got a corrupt file, so
that was the end of that idea (I just keep an older version
without all the fancy stuff).

A lot of stuff of calculations an estimates went into this.
Right now I'm too tired to explain all the details, but suffice
to say that 1140 feet per minute is the average speed of
ascent for the balloon according to the good packet info.
The speed and heading of the upper level winds is quite consistent
with the speed of the balloon which I calculated from ground
level to something like 27,000 feet in steps according to packet
info available.

Then, after building artificial composite wind files to feed
Balltrack, the results were plotted on three topo maps for burst heights of
80, 85, and 90k. Working backwards from the 1140
ascent, LIFTWIN predicts a burst around 85k. A descent speed
of 1400 ft/min. was used because this was mentioned on list.

The one mistake I might have made is to have the landing spots
too far west by a couple of miles. That would place them closer
to the air force base to the east.

My thought is that the balloon will be not too far from
a little east of Grand View.

Hank

2307. Re: Pilot available (and balloon landing spot)

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-31 11:54:14 UTC
From: n1ltv
Topic: 2287 Message: 2307

Taking all the information we have into account, the latest prediction I heard was for touch down about 9:16 AM, a full 70 minutes after the last report.

One thing I'm sure of is that it would be highly unlikely that the total duration would be another 70 minutes after the 77k report.

The descent phase happens relatively quickly because in the very thin air (almost none) at say 40k and up, the parachute descends very rapidly, several thousnads of feet per minute, so 70 minutes is too much. My estimates have it slightly over 30 minutes after burst (depending of course on burst height -- the burst height only slightly extends the descent phase because another 5000 feet at 85,000 takes hardly any time at all-- maybe an extra minute for each additional 5000 feet).

If someone has a better idea of where to search, we need to let Kurt know. We're thinking north east of Bruneau now.

I replotted with a better angle, and it only moves those map tragets about 1 1/2 miles to the east. My guess is the balloon didn't go a whole lot southeast of a line between Grand View and the AFB, but there are so many variables.

2315. TV02A Flight Path Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-03-31 18:55:17 UTC
From: K7JPS - John
Topic: 2315 Message: 2315

Well, I have a few minutes to help out in the discussion about the estimated landing site. The launch coordinates were N 42.74290? W 117.06701? Alt. 2290', launch time 7:00:00 MST. The last posit that was received at 8:06 MST was KD4STH-1>APT202,WIDE3-3:!4311.91N/11617.77WO098/014/A=077282. This gives an average ascent rate of 1136 FPM to that point which appears reasonable.

The winds aloft data from 12:00 Zulu (05:00 MST) reported 15 mph from 275? at 77165', so the direction of 98? and 14 mph is also reasonable. Also reviewing the wind files showed that the wind speeds kicked up to 35 mph at 81679'. The winds data file only had one bad data point and that was at 112896'.

Running BalTrak with the 1136 fpm ascent and an estimated decent of 1200 fpm and a burst of 77282' places the burst point at N 43.2264? and W 116.2628? and burst time of 66.0 minutes. So the TV02A was about 2.5 miles southwest of its predicted location (I need to learn to calculate distance and bearing in SA). Because I averaged the ascent rate based on this altitude the burst time coincides with the time of the last known Posit. The predicted landing for these variables is N 42.9872? W 115.8928? with a flight time of 96 minutes or 08:36 MST, bearing 131.1? true, range of 78.7 mi.

Running the same variables in BalTrak except for a burst alt. of 85000' gives a landing site of N 42.961? W 115.8378? flight time of 104 min or 08:44 MST, bearing 130.8? true, range 82.0 mi.

Both of these locations are along CJ Strike so we should probably be talking to fishermen at the reservoir, rather then airmen from Mountain Home AFB. Hopefully we stayed a little bit south of this since our actual track was farther south then the predictions.

It will take me some time to merge the know winds from our flight to the soundings file, but if someone has already done that, I would appreciate a copy. This would make the above predictions more accurate. I want to spend some time in the future learning to do this as well.

****

Here are a few thoughts I have about improving our procedures in the future.

1. I agree with Mike on the proximity of the two antennas. When we removed the stack from the tower, the antennas were actually able to touch each other because the antenna on the recovery beacon is made of very flexible cable (I don't remember the exact type).

2. We should consider designating someone at the launch site as communications specialist so that we can feed all the necessary info back to

mission control. My HT just did not cut it, and I was also too involved with handling the launch stack. We should have fed the launch coordinates and altitude back to mission control before we launched, and Tony was needing a countdown to launch as well. This info could then be posted to the group so that remote monitors like Hank, Zack and Mark could assist with updating the predicted landing site. And a Bulletin could be broadcast on APRS.

3. It was very helpful having a mission control, but without the necessary communications from the launch site, this position is very much in the dark until the balloon is up. I also liked the idea of having down range chase crews in position, although it didn't work out this time, it could be very helpful especially if we need to get a head start on Ding.

4. I know the MIM makes the capsule lighter then a TNC, but I have some reservations about it. On the last launch (TV01H) the data from KD4STH-11 was intermittent and most of the tracking was done from KD7INN-11. Also last launch my Kenwood D7A locked up several times and I was unable to operate any controls until I disconnected the battery. On this flight my HT also locked up, I could operate all controls except the PTT until I got home and read up on performing a partial reset of the radio - really bad for a single man chase vehicle. I don't think that I will be able to monitor APRS on future flights because of this problem. I would like to know if Justin had any problems with his new D7A too.

5. At our FRR or before we should spend some time discussing the settings of the command module. Randy tried to use the APRS in his truck as a relay, but the capsule was only set for wide, not relay. Also I discovered this morning that when I was on the radio giving updates from BalTrak I was calculating everything in decimal degrees, but the info Tony had from the capsule was in degrees and decimal minutes. Bad information is usually less helpful then no information.

It would have been around 0 degrees at that point. But we've flown
down to -90 degrees F in the past.

> Were both modules using e-Trex GPS receivers? Looking for a common
> denominator here.

Both modules also used alinco DJ-S11s and dipoles.

Doesn't it get colder, and then get warmer as you go up
> in altitude? How would the temperature at 77,000 feet compare with 26,000
> feet?

Around -20 degrees and warming

What was the "cabin" temperature at this point in the flight?

In the past, the interior temp hasn't dropped below freezing until
after balloon burst.

> Trak. Maybe 48 minutes later, by 8:06 and at 77,000 feet, the Tiny Trak

> speculation here. I know HP has always spec'd nearly all their equipment
> only to work in a "non-condensing" environment.

I don't suspect condensation is a problem. The air is incrediably
dry up there.

> By 8:06, the last report from -1 (and last report from either tracker)
> showed it 39 miles from its previous position on a heading of 133 degrees,

The capsule would have passed through the jetstream on the way
up. Speeds were probably above 70 mph.

> It doesn't seem like we suffered catastrophic failures so much as we

> batteries. And each module used independent batteries.

I suspect it wasn't a cato either. The batteries were either new, or
held a full charge.

> What happens to the conductivity / resistivity of the styrofoam as it get
> damp?

The flight computer sits on a layer of foamed neoprene rubber rther
than styrofoam. I don't imagine it's a problem, but we may want to
look at it. Perhaps neoprene is mildly conductive.

> Just to help fill me in - what exactly was the flight configuration as far as separate capsules/systems?

Yep, the capsule didn't make it home. within about 30 minutes, everything failed. We had two capsules with independent trackers, power, batteries, and antennas. They both use the DJ-S11 and Etrex. They use different TNCs.

It's fairly dry up here. I don't think condensation is that much of a problem. Air can flow in and out of the capsule. So what mositure there is, will be replaced with dry air aloft.

We have the antenna next to the TT. The TT is not shielded,
either. This may be a problem on TV02A.

> Group,
>
> Just thought I would share a photo that might bolster the theory sent out about the TinyTrak getting too much RF into it and shutting down. I took pictures of the stack before launch and noticed something that we might have caught on the ground. I saw
that the backup beacon antenna was on the
same side as the other main antenna. It is also not supported by any thing to keep it from wrapping itself around the other antenna and causing havoc. Could this have been a likely cause?

I think its even worse. Remember that the backup antenna was
attached just outside the recover aid package. We had a 340 mW
sources parked a couple of inches away from the TT.

John,

The maps I posted were based on an artificial or merged
sounding file using derived winds up to at least 27k feet.

Not having anything made up to do this meant a very tedious
process in the wee hours this morning. I'm just touching it
up now so I'll be sending that to you later.

Also, I did use a parameter that is probably in error and that
is a descent speed of 1400 feet/minute, not the 1200 you've used.
That would stretch out the landing spots I mapped. That descent
is an important figure; we're fortunate to have a pretty good
idea of the ascent.

I thought there was a figure of 1400 posted once.

Hey John, your coords place the balloon very VERY close to the river. As soon as the Bravada has its transmission fixed and if the capsules haven't been found yet, I was going to try your coords sometime later this week after class. Talk about geocaching at its best! This one should be called "Capsules with no Coords" Good work on the analysis!

2331. Condensation

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-01 03:53:51 UTC
From: Mark Conner
Topic: 2331 Message: 2331

I would expect condensation on descent rather than ascent. As you go up, your equipment is substantially warmer than the environment and you're going upwards into what is usually a dry environment. A corrolary to Tony's experiment would be to have a glass of warm water in a cold room.

On descent, the reverse happens. The equipment is now cold-soaked and entering a warm and relatively moist environment. Even so, I think condensation would not occur until the payload entered the lower troposphere (say, below 15,000 ft), if it occurred at all.

2335. NSTAR 02-B review

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-01 04:25:53 UTC
From: Mark Conner
Topic: 2335 Message: 2335

NSTAR 02-B had a successful flight on Saturday, March 30th from the Central Plains Severe Weather Symposium in Lincoln.

Most of the launch crew arrived between 7:30 and 8am in order to get parking spaces near the launch site in front of the conference center. I gave a presentation on NSTAR from 9 to 9:45, then we started the equipment setup outside.

About 10:35am we started to fill the balloon. This all went normally, and I noticed that the Kaymont "severe-weather" balloon was more round than teardrop-shaped after inflation. As we put the lanyards through the ring, I noticed that the heat shrink that I had around the knots on one of them had come off and the string was rather frayed. No matter, I thought, I'll fix it later if I get a chance.

The previous presentation ended at 10:45 and the crowd came out to watch the launch. Probably had a couple of hundred on hand. We winch the balloon out into position, check in with Lincoln Tower, do our countdown from five, then Wayne KE6DZD upends the crescent wrench holding the lanyards and away it goes.

For about fifteen feet. The lanyard snags on the ring - looks like a rat's nest up there. Nuts. Doug suggests cutting the lanyard away, but I give it a good tug to see if I can clear it (as if Doug's pulling wasn't good enough).

Suddenly the payload comes screaming earthward - the chute billows open and it all lands in front of the gasping crowd. My reaction, hopefully unvoiced, was "what the f***?" The balloon is still caught on the lanyards, but I figure it will slowly unravel itself and go free shortly.

I can see a length of string dangling from the balloon - initially I thought that was the load line and that it had snapped near the clip ring I use to attach to the top of the chute. I check the chute and a full length of load line is still there, so then I surmised it was sawed in two by the lanyards near the balloon neck.

Meanwhile we're carefully reeling the balloon back in, expecting it to go any time, most likely just before we can secure it. We catch a break, however, as I was able to get the free end of the lanyard and we get the balloon back. We attach the load line directly to the ring, then let the balloon out by the load line rather than risk a lanyard fouling again. So after a few more minutes and a check to make sure the payloads are still

functioning, we have our second launch of the day at 10:56am with the same balloon.

The chase team piles into their vehicles and off we go towards Nebraska City. Lots of contacts heard on the simplex repeater - it's working much better than the previous flight. I have my D7 in the car with me tuned to the backup beacon and the laptop is monitoring the primary. Both are going fine.

We knew ahead of time we were unlikely to be near the balloon at landing. Fortunately, Larry N0BKB, Mike N0GGU, and Steve N0ORU are already in Bedford, and Don KA0JLF, Cris N0XZB, and Bob K0FPC are heading north from St Joseph. Burst is at 78,760 ft, but the capsule APRS bulletin had it at 78,482 ft. Need to check the programming on this.

Landing was at 12:54pm (1854 UTC) between Clearfield and Diagonal IA in a plowed cornfield about 200 yds from the road. Again, no powerlines nearby, but if it had drifted downwind a bit farther it might have gotten caught in a copse of trees. All the payloads worked after the landing and nothing was broken. The chase teams headed for Corning for a pizza lunch.

The videotape shows that the VHF backup beacon caused a burp in the video recording every 30 seconds when it transmitted. This was probably due to the higher power and the antenna's proximity to the camcorder (it was directly above it and probably had a lot of radiation off the coax shield etc.).

Tony Barrett wrote:

> I don't think the cabin temperature needs to drop below freezing for us to
> get condensation.

It certainly doesn't. The name for the magic temperature is
the dew point. Anything below the dew point will have
moisture build up on it. It can be a big hassle for
astronomers. High humidity + cool temperatures = dew
buildup on your equpmnent...

> 18 inches seems too close for 2 meter transmitting antennas.

That may be, but they were the same distance at launch, and
hopefully you had valid aprs from both trackers before
launch. My bet is on condensation. I believe it fits the
pattern of this failure very well.

>I would expect condensation on descent rather than ascent. As
>you go up, your equipment is substantially warmer than the
>environment and you're going upwards into what is usually a dry
>environment.

That sounds reasonable, but I'm pretty sure another group
that had a similar problem had their failure on the way _up_
too. I wish I could find a link to the web site I'm
thinking of. You may have seen it, it came up in the flight
controller discussion a few months ago. I believe the story
went something like: They had an in flight failure, then
duplicated it by spraying the tracker board with circuit
cooler until it started to show condensation at which time
they got a failure similar to the one thay had during the
flight. They started coating their boards and never had
another failure.

I spent a little time looking for a source on PC board
coating in a spray can, but haven't found anything yet. I
did find a source with a minimum 1 quart container of an
acrylic based PC coating, but no price and availability info
without calling them. I have a feeling even a couple coats
of clear acrylic spray paint would take care of condensation
problems, just make sure the dried paint isn't conductive
before you do a board.

> flight computer and the Tiny Trak.

I agree.

What was the launch temperature? Any idea about humidity?
Was there dew on things around the launch site?

> I suggest we take a working station on the ground and spray a water mist on
> the board to see what happens.

Living dangerously... be sure to disconnect power once it
fails, you don't want to do too much damage. That other
group used circuit cooler to cool the board causing
condensation. (Sure wish I could remember the URL.) You
could also put the board in the freexer then move it into a
high humidity area. Spraying water on a board just feels so
-- wrong!

> If we don't want to use conformal coatings there must be other ways we
> can protect the boards from condensation.

What could possibly protect the boards better than the
industry standard coatings for that job? Even at $50/can
coating the boards is cheap compared to losing capsules. I
believe you will find most aircraft electronics is coated,
or potted, and much of that flies on the inside of the
cabin.

> I don't think the cabin temperature needs to drop below freezing for us to
> get condensation.

That's a true statement. Once the air temperature drops below
(ideally) the dew point, you get condensation. The air is very dry in
the upper atmosphere. I don't think condensation is the problem
since it has never been a problem in 31 flights. The boards are
placed on a base that would make condensation tough.

> Passed through the jet stream? Really? I thought the jet stream was
> running a few hundred miles north of us recently. Maybe we're talking
> about a different jet stream.

Bad choice of words on my point. I was referring to the fastest
winds we would experience. We're outside the jet, but still see
high speed winds at the jet's altitude.

> If you'd rather not have this discussion in this forum, just let me
> know. I'm not trying to be disagreeable. Just trying to share ideas and

It's not a problem. I want this to be an open forum. Information
needs to flow.

Paul

2343. Battery Failure

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-01 14:39:51 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2343 Message: 2343

I'm attaching a cleaned up copyof the KD4STH-11 telemetry log. The battery on the command module died during the flight. There was a continous drop in voltage to 5.3 volts. The voltage did not hold at a low value long enough to force a reset on the flight computer. At the very top of the file is the explanation for the analog values (I got Servo voltage and Auxillary voltage fields turned around). Friday nigth the measured voltage of the main battery was 6.3 volts. Use that for the value of the first analog to digital value. See how the values steadly drop through the flight. At the last packet, the voltage is 5.3 volts.

Also, looking at the log I can see that most of the telemetry packets got out, but very few of the posit on demand packets did. The posit on demand occurs when the A3 line is brought low.

I thought about batteries this morning on the way into work. Nicads are discharged at 0.9 volts per cell. The capsule flew with 5 cells in series for a total of 6.0 volts. However, when they discharge, they will be at 4.5 volts. The voltage regulator is a low drop regulator and will provide 5 volts until the source drops to 5.25 volts (by my measurements). The disharged voltage of the flight battery really should have been 5.4 volts. So the charged value becomes 7.2 volts. I need six cells on the flight battery to be able to get the best lifetime. Unfortunately this means there's a 2.2 volt waste at the beginning of the flight.

As far as condensation. There was some high cirrus clouds, and as I recall, we didn't get any culumus later in the day. This indicates to me (Mark, can you correct me), that the air was very dry. Cirrus occurs when the dew point is below freezing, cumulus occurs when the dew point is above freezing. Also, as I recall, there was no dew on the grass when we launched. I really don't think condensation was the issue here.

Doug brought up a good point. We didn't see RF problems on the ground. So why should they start only after launch?

At least we know the batteries died on the command module.

Paul

2344. Re: [tvnsp] Any recovery mission ideas?

The predicted landing positions for different burst altitudes and
landing speeds should follow a straight line (a heading of 131
degrees as I recall). It would seem best to follow a track along that
heading.

Good luck.

On the FRR I want to add the following items. We'll need to put this into a checklist and document the values.

First, we need to connect the batteries, power up the capsule, and measure the current.

Second, we need to record the battery voltages and the telemetry values associated with them.

I started a new chapter in my book last night about flight qualifying and preflight testing. Writing the outline added another three pages to the book.

okay, just an idea... The only way I can imagine two separate APRS systems
failing at once....
would be some kind of mechanical disturbance (catastrophic)
Theory 1) It plummeted to earth and is now a pancake.
Theory 2) It got eaten by an airplane
etc
etc
etc

Has anyone verified the chunk of earth
below where the craft was last recorded?

Subject: Re: [tvnsp] TV02A pt 2

> Just to help fill me in - what exactly was the flight configuration as far
as separate capsules/systems?

Yep, the capsule didn't make it home. within about 30 minutes,
everything failed. We had two capsules with independent trackers,
power, batteries, and antennas. They both use the DJ-S11 and
Etrex. They use different TNCs.

It's fairly dry up here. I don't think condensation is that much of a
problem. Air can flow in and out of the capsule. So what mositure
there is, will be replaced with dry air aloft.

We have a record from 77,000 feet. So it didn't collide with an
airplane. The -11 capsule failed when its battery died.

This still leaves the issue of why there were so few posits and why
the -1 capsule failed.

What are the coordinates of the last record at 77,000 K ?

Paul, in your professional opinion, if it were to plummet to earth....
what kind of search radius should we be looking for, relative to the
last coordinate? I could use a nice hike/mtn bike ride after work :)

>think condensation was the issue here.

Clouds with water droplets can form at altitudes above freezing. The small size of the droplets lets them stay in the liquid state. At -10 to -20 C you then begin to see more in the way of ice crystals in clouds, and at cirrus altitudes and temperatures (-40C range) they're all ice.

The 12Z BOI sounding for Saturday morning
http://weather.uwyo.edu/cgi-bin/sounding?region=naconf&TYPE=GIF%3ASKEWT&YEAR=2002&MONTH=03&FROM=3012&TO=3012&STNM=72681
(url needs to be all one line)
does not show any layers near saturation, but there can be a lot of small-scale variations not reflected in the soundings.

I have my circuit board in a plastic project box that is not airtight but allows only minimal air movement in and out. This probably minimizes the amount of free air that can get to the board during descent and thus minimize the amount of moisture that can be transported to the board and then condense on it. It also keeps me from shorting out traces if I were to drop some bit of metal near it. Spraying the board with an insulating material is probably better, and prevents the exposed copper from tarnish/corrosion.

When I noticed the RF lockup of the TinyTrak during my testing last week, it didn't happen immediately. It had been running for a few minutes then it locked up. It's possible random variations of the antenna or capsule orientation may have brought enough RF onto the TT2 board at some point into the flight, but not during the powerup on the ground.

>The disharged voltage of the flight
>battery really should have been 5.4 volts. So the charged value
>becomes 7.2 volts. I need six cells on the flight battery to be able
>to get the best lifetime. Unfortunately this means there's a 2.2 volt
>waste at the beginning of the flight.

I run NiMH packs for my capsules - more capacity per unit weight and volume. I also decided on a 6-cell configuration despite the "waste". At full charge, the no-load voltage is about 8.4V. When I turn on the

steady-state load (no transmitting) this drops to about 8.1-8.2V. The transmitter knocks off about 0.2-0.3V when it keys up. The batteries are pretty good down to about 6.6V, then after that the voltage depression when the transmitter keys up is pretty steep. There's very little capacity between 1.1V/cell and "dead" anyway. Another reason I went 6-cell was to provide more voltage for the radio - the power output was quite a bit less at 5-6V than it was at 7-8V.

There are three-terminal switching regulators that are supposed to be high-efficiency pin replacements for the standard types. I think they are $7 or more each, and I can't remember what their low-voltage characteristics are like. I think their drop-out voltage is higher (perhaps 2.0V instead of 0.25V) which negates a lot of the efficiency gains for a 6-cell pack to provide 5V bus voltage.

The NiMH packs have been very predictable now that I have a good charger, know what a good charge cycle looks like voltage-wise, and put the cells into a pack in the right orientation (I got one cell backwards for my first pack and flew it that way twice before it failed). The lithium cells were too expensive for me new, and were too much like Forrest Gump's box of chocolates for the surplus ones. Plus I can test in my flight configuration multiple times and not have the expense of the one-use batteries.

I think the voltage telemetry tells the tale for the primary beacon. On the backup beacon, what power was used for the transmitter? Do we know what the battery life for the backup beacon was like? On NSTAR 02-A our backup beacon had too little power to reliably transmit packets that could be decoded on the ground. My home station lost track of it above 40,000 ft (probably distance caused the fading, not altitude), but one lone packet was decoded at 90,000 ft during ascent. For 02-B at the higher power setting we had little trouble.

I didn't bring that with me to work. Can someone forward that to
the list.

The balloon may have burst at 77,000 feet. The parachute really
wouldn't fail. From the symptoms I see, the balloon worked fine,
there was no impact.

The HT was a DJ-S11. It's output is 340 mW. We've had
telemetry from the S11 in the past, but I was wondering this
weekend about going to the Vertex.

I wonder if that's the scenario for this flight. We did listen for bad
packets after the -1 beacon cut out and thought we heard a few.

These are the position reports from KD4STH-1 with elapsed
time inferred from the altitude gains.

Note that reports begin to be missed as early as minutes four
through six which should have appeared as low as 7000 feet
altitude.

Readers to the list tuning in today are advised to read
John Stone's message (TVNSP #2315, Sunday) for an excellent
summation of events and positions, and a prescription for what
needs to be fixed, both with respect to hardware and to TVNSP
procedures.

Paul,

I think organization of a recovery effort is very important in case this landed in an area where it might be picked up by someone and not returned, or float or wash away.

However, since the battery subject has come up, could you please give the list a rundown on the complete battery complement in use on this payload including built-in HT batteries. Cell size, number of cells, cell chemistry.

For how many flight have you been using ni-cads, and have you sucessfully used 5 in series before to power that same device?

Hank

The Etrex has its own alkalines. The HT and flight computer use 6
volts worth of nicads. The TTII uses a 9v alkaline. It's radio uses 3
"AA" alkalines.

Thre nicads were on their third flight.

From: Zack Clobes
Topic: 2279 Message: 2360

The condensation problem you are referring to, I believe, was ours. However it was on the way down that we lost contact.

Everything was working fine down through about 8k. The internal temp was approaching 0C. The last packet received was about 8,500 as I recall which I assume was about the height of a heavy semi-dark layer of clouds (nearly overcast if my memory serves me). Just shortly after the last packet, the transmitter keyed up (I'm guess this was simply a water-induced short between the PTT/Mic line and ground and a squealing was heard). We're using a custom modem (MX-614) which tends to produce a steady state audio tone when things aren't going well for it.

The coating that we've been using is made by MG Chemical and it's part number is 422-1. It's just called Conformal Coating. Our was purchased locally, but I think you can find it from Newark Electronics. Ours is a brush-on type and we usually put on 2-3 heavy coats on top and bottom. The stuff does go away with heat (i.e. you can still de-solder after applying the coating).

It certainly doesn't. The name for the magic temperature is
the dew point. Anything below the dew point will have
moisture build up on it. It can be a big hassle for
astronomers. High humidity + cool temperatures = dew
buildup on your equpmnent...

> 18 inches seems too close for 2 meter transmitting antennas.

That may be, but they were the same distance at launch, and
hopefully you had valid aprs from both trackers before
launch. My bet is on condensation. I believe it fits the
pattern of this failure very well.

>I would expect condensation on descent rather than ascent. As
>you go up, your equipment is substantially warmer than the
>environment and you're going upwards into what is usually a dry
>environment.

That sounds reasonable, but I'm pretty sure another group that had a similar problem had their failure on the way _up_ too. I wish I could find a link to the web site I'm thinking of. You may have seen it, it came up in the flight controller discussion a few months ago. I believe the story went something like: They had an in flight failure, then duplicated it by spraying the tracker board with circuit cooler until it started to show condensation at which time they got a failure similar to the one thay had during the flight. They started coating their boards and never had another failure.

I spent a little time looking for a source on PC board coating in a spray can, but haven't found anything yet. I did find a source with a minimum 1 quart container of an acrylic based PC coating, but no price and availability info without calling them. I have a feeling even a couple coats of clear acrylic spray paint would take care of condensation problems, just make sure the dried paint isn't conductive before you do a board.

Why don't you just let the controller do the match on the A/D conversion in the air so you can actually have real values (mine come down as a long type (C) in mV). It would be much easier to catch a bad battery voltage or programming error if you didn't have to manually run calculations on it each time.

On the FRR I want to add the following items. We'll need to put this into a checklist and document the values.

First, we need to connect the batteries, power up the capsule, and measure the current.

Second, we need to record the battery voltages and the telemetry values associated with them.

I started a new chapter in my book last night about flight qualifying and preflight testing. Writing the outline added another three pages to the book.

Paul,
Did both trackers share the same Etrex or did each tracker have it's own GPS? Was the Etrex for the Tiny Track II exposed to the cold? I believe someone mentioned that this tracker was on top of the parachute. How well insulated was it? If the alkaline batteries became cold the Etrex would have shutdown and it won't restart. We experienced this on a flight last year when my capsule flew for the first time. I tested this problem by using my freezer. I changed to NiMH batteries and also added external battery power. For the external batteries I built an insulated battery box and still used 2 AA alkalines.

>The HT and flight computer use 6 volts worth of nicads.

Are these the same nicads, in other words is one set
of nicads powering both the HT and FC. What size are
these nicads?

I hope the answer is not AA.

Whatever size they are, 6 volts is inexcusable for
powering mission critical systems that absolutely,
positively need 5 volts. This was an accident waiting
to happen.

Nicads are poor cold weather performers. Boise's
temperature at 6 AM Saturday was about 30 degrees.
This may have been the coldest that this arrangement
of nicads ever has been *prior* to launch, although
the normal low for Boise November 17 is 31.

I would not think it excessive to add not just one but
two more cells and it might be better to have an
independent battery for the FC.

This is the same question I asked Paul in a private email. Now I will throw it out to the group. My question was 'if the air temperature is below freezing would it affect anything?' Not sure of the exact wording but what I am getting at is this: In Meridian the moring temperatures have been at freezing or a little lower, generally colder than at the airport where the official temps are taken. Since Adrian is a little higher in elevation and the capsules are open to the air while the batteries are connected, switches turned on, etc could the capsules actually be colder than the surronding air after launch. If I remember correctly, we generally have a layer of cold air next to the ground and the air warms up a little before getting colder again - a slight inversion. I don't remember if we had ice on Saturday morning or not, too sleepy to remember I guess. And since I was on the headstart team, we were running about an hour later then the rest of the group.

No they had their own nicads. The batteries were AAs.

Why would you put the GPS outside anyway? While testing our setup, we've found that a GPS looking through several inches of Styrofoam only causes about a 2db loss. There's plenty of signal for posit lock once you get above the trees/buildings.

Paul,
Did both trackers share the same Etrex or did each tracker have it's own GPS? Was the Etrex for the Tiny Track II exposed to the cold? I believe someone mentioned that this tracker was on top of the parachute. How well insulated was it? If the alkaline batteries became cold the Etrex would have shutdown and it won't restart. We experienced this on a flight last year when my capsule flew for the first time. I tested this problem by using my freezer. I changed to NiMH batteries and also added external battery power. For the external batteries I built an insulated battery box and still used 2 AA alkalines.

6 volts is pretty shy for a 5V circuit - all depends on your regulator drop though.

As for OAT, on our first attempt at 2002a, the OAT was below 20F with a wind chill closer to 0. It was quite interesting though that the IAT of the capsule was still about 15C once we got the transmitters up and running (while sitting on the ground - the capsule actually didn't fly that day). We had a VX-1R, Garmin 35-HVS, and a 1.5W ATV transmitter all running.

Are these the same nicads, in other words is one set
of nicads powering both the HT and FC. What size are
these nicads?

I hope the answer is not AA.

Whatever size they are, 6 volts is inexcusable for
powering mission critical systems that absolutely,
positively need 5 volts. This was an accident waiting
to happen.

Nicads are poor cold weather performers. Boise's
temperature at 6 AM Saturday was about 30 degrees.
This may have been the coldest that this arrangement
of nicads ever has been *prior* to launch, although
the normal low for Boise November 17 is 31.

I would not think it excessive to add not just one but
two more cells and it might be better to have an
independent battery for the FC.

How do you plan on measuring current? It sounds like a good idea but I'm not sure if it's worth disconnecting and reconnecting batteries as well as having meter leads and a bunch of hands running around a capsule minutes before launch. Plus you'd have to disconnect and reconnect unless you're using a shunt resistor (which would add extra weight and voltage drop) which adds to the complexity and margin of error. Maybe watching battery voltage immediately before and after powering up all equipment would be a good indicator?

Subject: [tvnsp] FRR

On the FRR I want to add the following items. We'll need to put
this into a checklist and document the values.

First, we need to connect the batteries, power up the capsule, and
measure the current.

Second, we need to record the battery voltages and the telemetry
values associated with them.

I started a new chapter in my book last night about flight qualifying
and preflight testing. Writing the outline added another three pages
to the book.

Additional recallection comment:
The launch area was surprisingly dry and calm right up to launch.
There was no frost on the grass. I can confirm this since my
knees did not get wet while they were on the protective sheet
and sometimes directly on the grass. I also remember looking at my
temperature guage in the pickup when we arrived at the launch site.
It read 39F on the outside sensor.
In fact i noticed no one exhaled the normal frosty breath trails
during launch preparation. It was generally a comfortable morning
for launch compared to many past launches.
A minor observation,but more data to add to the speculation pot :)

From: Stephanie Steele
Topic: 2379 Message: 2379

I would love to see a schematic of how the recovery beacon equipment was wired and powered and what, if any, insulation was provided for the Etrex. I have a theory but I will keep it to myself until I have this information.

Stephanie

Tony Barrett wrote:

The recovery beacon GPS must have kept going or restarted itself somehow. We got posits from it for the first 18 minutes, then nothing until 66 minutes into the flight, and then only a single report. Nothing was heard after that. Seems like if the GPS turned off we would not have seen the report at the 66 minute mark from 77,000 feet.

At 01:39 PM 4/1/02 -0700, you wrote:

Paul,
Did both trackers share the same Etrex or did each tracker have it's own GPS? Was the Etrex for the Tiny Track II exposed to the cold? I believe someone mentioned that this tracker was on top of the parachute. How well insulated was it? If the alkaline batteries became cold the Etrex would have shutdown and it won't restart. We experienced this on a flight last year when my capsule flew for the first time. I tested this problem by using my freezer. I changed to NiMH batteries and also added external battery power. For the external batteries I built an insulated battery box and still used 2 AA alkalines.

2380. Re: [tvnsp] KD4STH-11 log with extra notes

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-02 03:48:40 UTC
From: Zack Clobes
Topic: 2354 Message: 2380

I'm having a hard time getting the ascent rates of 1136 (as averaged by someone else on the list.. I don't remember who). By using Hank's numbers below, it looks to me like the ascent rate was more like 1205 ft/min. (Average the first 11 reports and forget the last one since we don't know if that's comin or goin). The only way I get anything close to 1136 is if I average from report 1 to report 12 (which yields about 1140 ft/min).

If we use only the first eleven and assume that we have a 1205 ft/min ascent and -8000 ft/min descent (immediately after burst), then that would put a burst at approximately 65.5 minutes and about 81,000'. At that altitude, it appears that wind speeds were in their 20's and therefore the last report at 77k would be very close to the actual burst point (within about a half mile).

Since I'm having a hard time finding any kind of a time stamp in the received data, I'm left to assume that Hank was using approximation to get the time for the individual packets and therefore the above numbers may be slightly skewed. However, from a mechanical/electrical standpoint, it would make sense that a piece of equipment would either start or stop running just after burst because of the shear violence of the tumble - surely that would be sufficient to knock around some water droplets or make/break a loose connection.

Upon looking at the logs more closely from Tony, he brings out the fact that the -11 continued to transmit telemetry (no posits) for 17 minutes. Paul, how is the software written to allow it to continue telemetry without posits? Does it continue to send telemetry (and ignore posits) if the GPS dies? Should the controller been sending out some sort of error message under these conditions or not?

And finally, Project: Traveler has made it a policy that any potentially useful data (i.e. posit and telemetry but not general broadcast/status messages) must also include at least hour/minutes if not hour/minutes/seconds. The current UTC time is swiped off the NMEA data stream from the GPS. If the GPS should fail, the controller goes into a failure mode that just transmits telemetry with a time of '0000'. It has greatly improved our ability to combine log files and get the telemetry/position data chronologically correct.

Just my couple of cents.

Subject: [tvnsp] KD4STH-11 log with extra notes

These are the position reports from KD4STH-1 with elapsed
time inferred from the altitude gains.

Note that reports begin to be missed as early as minutes four
through six which should have appeared as low as 7000 feet
altitude.

Readers to the list tuning in today are advised to read
John Stone's message (TVNSP #2315, Sunday) for an excellent
summation of events and positions, and a prescription for what
needs to be fixed, both with respect to hardware and to TVNSP
procedures.

I'm rather new to the flight prediction stuff, but I'm putting my money on a couple miles north or north-east of Grand View. Maybe a little more to the south from this plot.

Zack

> yields about 1140 ft/min).

The 1140 is what I've posted to this list and is based, purposely and necessarily on the time to attain 77k. It is done that way to work into Balloontrack with the assumption that the 77k is either right at burst or still on the way up. I noticed Saturday that the ascent for the first 20 minutes was a little higher.

Hello Team and Friends,

I'd like to propose that we make it SOP to run three successful "tethered" full-duration "flights" (no balloon) of a "frozen" design / configuration prior to any actual flight. We could hang it from a tree so it swings in the wind. We could run it at night so its a little colder. We could run on odd frequencies so we don't bother folks. I thought about dummy loads, but that would defeat the purpose. Even testing on another frequency introduces some risk. Maybe we "fly" between 2 and 6 AM so no one cares about the added packet-racket on 144.39. Once we prove this works (three successful flights in a row with no design changes), then we're ready for an actual balloon-borne flight. This would shake out the RF bugs, if there are any, but would not give us the affects of cold and altitude. Anyway, three sets of batteries seems cheap, and it might even be a fun confidence builder. We could practice "launching", "data" logging, digi-peating, analysis, etc. During "flight" nothing should radically shift position; e.g. we can't have one antenna falling down on another. We could even "fly" in the back of a pickup truck.

We could even get brave and torture test the whole arrangement. We could do a four hour shock and vibration test. We could spray water on it. We could beam high powered RF at it. If it survives that, a trip to near-space would be as smooth as - well as smooth as a ride on a balloon.

Those are my thoughts. We need more practice and design verification, which can be just as much fun as real flights - even more fun than flights where we lose it all. For many years I worked as a reliability engineer on LaserJet printers. We cut total failures in a very complex system by 90% and cut manufacturing costs in half - DURING THE SAME TIME PERIOD. I think I can bring a lot of reliability engineering experience to the team.

Here's another idea. Run an entire practice "flight" in a freezer. It provides cold and RF shielding!

Maybe we should require that all battery systems be frozen and still power their loads for 3X the expected flight duration.

Maybe we go to beacons once every 10 minutes after four hours so the batteries last long enough for us to find the capsules. It would be great if the TNC / radio batteries lasted as long as the GPS batteries, which is about 18 hours (?) if memory serves.

We still don't know we suffered a battery failure. Maybe one, but two?

Another thought occurred to me. I had a pipe freeze up here at the house once. The very well insulated pipe froze because it was insulated from any

source of heat! Perhaps our separate foam compartments don't allow our loads to heat our sources (batteries).

Just suggestions.

Tony

From: Stephanie Steele
Topic: 2345 Message: 2388

I second Tony's thoughts on this. I would probably not have suggested quite as comprehensive a testing procedure but we really should so some real time testing. I especially like the suggestion to "fly" the flight ready packages in the back of a pickup, again using a road trip to a high altitude location to test assent and descent performance of the tracking / recovery systems.It would not be too difficult to build a structure to suspend the capsules in the rear of a pickup so they can swing and twist and experience thermal loss from air movement.

Just the thoughts of a mad woman.

I know, shut up and get back in the kitchen.

I suggest you change from "full-duration" to "run it till it
dies." When it does die find out which set of batteries
gave up first, and consider how long it took. Maybe you
want to use stonger batteries.

Also add "of that configuration" to the end of the last
sentence. No need to waste three sets of batteries if you
don't change anything between flights.

> We could run on odd frequencies so we don't bother folks. I thought about dummy loads,

I think different frequency is a good idea, with little
risk. My biggest worry would be that the transmitter
battery life is different on the alternate frequency, which
is easy to control for. The next risk would be forgetting
to reset the frequency before launcn, which should be
rapidly noticed during pre-flight testing.

> We could even "fly" in the back of a pickup truck. We could
> do a four hour shock and vibration test. We could spray water on it.

Combine them all and go four wheeling in the rain... Sounds
fun! If the tracker can't take it how do you trust it for
flight?

> We could beam high powered RF at it.

I don't see much RF risk for most flights. I guess you
could come down thru the beam of a high power microwave
link, or near a radio station's transmitter, but the odds
are small. You should be testing for interaction with
transmitters and noise sources in the capsules though.

It should be easy enough to test various arrangements of
flight components in an attempt to keep the batteries warm.
But then how much heat does the flight electronics put out?

> Maybe we should require that all battery systems be frozen and still power
> their loads for 3X the expected flight duration.

Which is still pretty short when you consider the elapsed
time between launch and a problem recovery. I think one of
the Twin Falls launches it was nearly 36 hours.

> Maybe we go to beacons once every 10 minutes after four hours so the
> batteries last long enough for us to find the capsules. It would be great

Even 30 minutes between transmissions might not be bad after
a few more hours. That might give you time to get to high
ground where you might have a better chance of receiving.
Consider sending for one full minute during minute 0 and 30
of each hour. Even if the GPS data is bad, you would have a
chance with RDF.

> Just suggestions.

Good ones, IMHO.

So far the best start for a balloon tracker I've seen is
Zack's:

http://www.rckara.org/tech_exchange/projects/aprs_board/construction.asp

I wish I had more time to play with this... I'm very
interested in the possibility of sending commands to the
balloon in APRS messages.

I too like Tony's idea. We can tether the capsules to a smaller balloon and let it fly all day and night. On ebay, you can find 100 and 300 gram Kaysam balloons CHEAP! If you really want to test for temp and alt. we can always take a trip to the top of Borah Peak. YA RIGHT!

The etrex would not be put outside but if it was in a small box on top of the parachute it could not have been well insulated as it needs to be.

Why would you put the GPS outside anyway? While testing our setup, we've found that a GPS looking through several inches of Styrofoam only causes about a 2db loss. There's plenty of signal for posit lock once you get above the trees/buildings.

Subject: [tvnsp] One or two Etrex?

Paul,
Did both trackers share the same Etrex or did each tracker have it's own GPS? Was the Etrex for the Tiny Track II exposed to the cold? I believe someone mentioned that this tracker was on top of the parachute. How well insulated was it? If the alkaline batteries became cold the Etrex would have shutdown and it won't restart. We experienced this on a flight last year when my capsule flew for the first time. I tested this problem by using my freezer. I changed to NiMH batteries and also added external battery power. For the external batteries I built an insulated battery box and still used 2 AA alkalines.

I looked through the manual for my eTrex and under the specs, the temperature range is 5-158F (-15-70C)while operating. It goes on to say that "Alkaline batteries lose a significant amount of their capacity as temp decreases. Use lithium batteries when operating in below freezing conditions" Would it be below 5 degrees at or after the last packet received? Were lithium batts. used? Hope this helps any.

2393. Re: [tvnsp] Re: One or two Etrex?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-02 08:55:17 UTC
From: Jeff Melanson
Topic: 2362 Message: 2393

Justin,

Last year I placed my etrex in my freezer with two fresh alkaline batteries (all in a ziplock bag) and the GPS shutdown in one hour. My freezer temperature is 0 degrees. The battery indicator showed that the batteries were dead. I then placed the etrex in room temperature and one hour later the battery indicator showed a 90 % capacity. I effectively showed that alkaline batteries will fail in a near space capsule. They cannot deliver enough current when they are cold. This test demonstrated what happened when I flew my eqiupment for the first time in Paul's capsule in Twin Falls last year. When Stephanie and I found the capsule (after much adventure) we found the etrex shutdown with plenty of battery power left. When I built my own capsule I made it very tight (in other words no air gaps). I also placed NiMH batteries in the etrex. Nickel Metal Hydride batteries are not affected by cold to the same degree as alkalines. In addition I added external power to the etrex. These were 2 AA alkalines. These external batteries were placed in an insulated box inside the space capsule. The etrex was also in an insulated box near the top of the capsule. The etrex will use external power first when it is available. If that voltage becomes to low the etrex will switch to internal power. After my next flight I found that the voltage of both the NiMH batteries and the alkalines was lower. The etrex had used power from both sources. Hmmm... I'm not ready to draw any conclusions from this without further testing. Perhaps someone else would like to do some similar tests.
Consider this. I hooked up a variable power supply to the etrex at 3 volts (in place of the batteries). I then slowly lowered the voltage until the etrex shut down. It shut down when the voltage dropped to 2.2 volts. NiMH batteries put out 1.2 volts per cell. Two of these batteries give you 2.4 volts. That's only .2 volts over the shutdown voltage. Thats why I used the alkalines for the external power (to get 3 volts). Perhaps I should use NiMH 'D' cells instead.
The down side to the etrex is that once it shuts down your done. It won't restart. I have been considering one of those GPS units that have no display or controls. You put power on it and they start up. The advantage would be that if your batteries become to cold and your GPS shuts down then when your batteries warm up the GPS would restart. Something to think about.

Jeff

Thanks for the insight. That's strange how that works out. You think a solar cell would help out for the hour or two that the temp. hinders battery voltage?

> How do you plan on measuring current?

In my design, I can disconnect a battery without any trouble. I'll solder up a connector cable that will allow me to reconnect the battery with a DMM in between. The test will be done at the FRR. After the FRR, the capsule is not reconfigured, so if it passes the night before, it should be good the morning of launch.

> And do you think that condensation could have caused an extra load that
> drained the battery?

No. The bottom of the board is coated with a layer of neoprene
rubber. That would leave condensation on the top surface, but I
believe there's enough gap between traces to prevent condensation
from bridging the gaps. Also, remember, condensation is pure
water, which has a low conductivity.

Yes, but how would you get ice crystals inside the capsule and on
the board? Remembere there is styro peanuts around the board.

I wonder if that was due to the shock of balloon burst.

Hi,

I might suggest the use of a Garmin GPS-35 for you primary beacon. It weights about 5 oz. and one version does fine off +5V. I feed mine off the same regulator that powers the controller board. Size and shape is about that of a computer mouse.

As soon as power is applied, it spits out NMEA sentences. You can control which ones are output, and there's a 3D velocity sentence so you can determine vertical velocity. Time to first fix is very good and if power is briefly interrupted it will come back up normally (i.e., it won't shut down and stay off). The built-in antenna has very good performance - I get a 6-satellite lock in my house and I've had it provide at least 2D fixes after landing with the antenna up-side down.

I got my last one from CDW for about $160. List is closer to $200.

I would love to see a schematic of how the recovery beacon equipment was wired and powered and what, if any, insulation was provided for the Etrex. I have a theory but I will keep it to myself until I have this information.

I don't have a schematic, but here goes. The TT was connected to the HT with 1/8" and 3/32" jacks. The Etrex was connected by a DB-9. The entire package was enclosed in a sytrofoam box with pockets. The pockets were cut just large enough for the etrex, ht, and TT.

The TT was soldered to a pref board, along with DTMF decoder.

I have a 1.2A @ 12VDC balloon package that could be attached to any flight. The capacity will increase at altitude. The design is such that (most likely) it will land with the cells facing up. This will give electrical capacity (when the sun shines) for a very long time.

Paul, how is the software written to allow it to continue telemetry without posits?

The MIM is programmed to send telemetry every two minutes. All other data is sent by forced posits. I send text to the MIM and pull the A3 line low. What ever data was sent to the MIM is then transmitted.

The time required would prevent me from doing three of them. A
new flight computer needs to be tested like that. It also needs to
have its current draw characterized. Once a capsule is configured
for flight we need to run additional tests, like current draw. I'd add
a shake test if the capsule is packed any differently that before.

We've used the Energizer AA lithium cells on all three of our flights with excellent luck. You can find them at Wal-Mart for about $2.50 per cell. They usually hide them with the cigarettes because kids are making methanphetamine out of them.

Subject: Re: [tvnsp] Re: One or two Etrex?

Justin,

Last year I placed my etrex in my freezer with two fresh alkaline batteries (all in a ziplock bag) and the GPS shutdown in one hour. My freezer temperature is 0 degrees. The battery indicator showed that the batteries were dead. I then placed the etrex in room temperature and one hour later the battery indicator showed a 90 % capacity. I effectively showed that alkaline batteries will fail in a near space capsule. They cannot deliver enough current when they are cold. This test demonstrated what happened when I flew my eqiupment for the first time in Paul's capsule in Twin Falls last year. When Stephanie and I found the capsule (after much adventure) we found the etrex shutdown with plenty of battery power left. When I built my own capsule I made it very tight (in other words no air gaps). I also placed NiMH batteries in the etrex. Nickel Metal Hydride batteries are not affected by cold to the same degree as alkalines. In addition I added external power to the etrex. These were 2 AA alkalines. These external batteries were placed in an insulated box inside the space capsule. The etrex was also in an insulated box near the top of the capsule. The etrex will use external power first when it is available. If that voltage becomes to low the etrex will switch to internal power. After my next flight I found that the voltage of both the NiMH batteries and the alkalines was lower. The etrex had used power from both sources. Hmmm... I'm not ready to draw any conclusions from this without further testing. Perhaps someone else would like to do some similar tests.
Consider this. I hooked up a variable power supply to the etrex at 3 volts (in place of the batteries). I then slowly lowered the voltage until the etrex shut down. It shut down when the voltage dropped to 2.2 volts. NiMH batteries put out 1.2 volts per cell. Two of these batteries give you 2.4 volts. That's only .2 volts over the shutdown voltage. Thats why I used the alkalines for the external power (to get 3 volts). Perhaps I should use NiMH 'D' cells instead.
The down side to the etrex is that once it shuts down your done. It won't restart. I have been considering one of those GPS units that have no display or controls. You put power on it and they start up. The advantage would be that if your batteries become to cold and your GPS shuts down then when your batteries warm up the GPS would restart. Something to think about.

Justin,

Last year I placed my etrex in my freezer with two fresh alkaline batteries (all in a ziplock bag) and the GPS shutdown in one hour. My freezer temperature is 0 degrees. The battery indicator showed that the batteries were dead. I then placed the etrex in room temperature and one hour later the battery indicator showed a 90 % capacity. I effectively showed that alkaline batteries will fail in a near space capsule. They cannot deliver enough current when they are cold. This test demonstrated what happened when I flew my eqiupment for the first time in Paul's capsule in Twin Falls last year. When Stephanie and I found the capsule (after much adventure) we found the etrex shutdown with plenty of battery power left. When I built my own capsule I made it very tight (in other words no air gaps). I also placed NiMH batteries in the etrex. Nickel Metal Hydride batteries are not affected by cold to the same degree as alkalines. In addition I added external power to the etrex. These were 2 AA alkalines. These external batteries were placed in an insulated box inside the space capsule. The etrex was also in an insulated box near the top of the capsule. The etrex will use external power first when it is available. If that voltage becomes to low the etrex will switch to internal power. After my next flight I found that the voltage of both the NiMH batteries and the alkalines was lower. The etrex had used power from both sources. Hmmm... I'm not ready to draw any conclusions from this without further testing. Perhaps someone else would like to do some similar tests.
Consider this. I hooked up a variable power supply to the etrex at 3 volts (in place of the batteries). I then slowly lowered the voltage until the etrex shut down. It shut down when the voltage dropped to 2.2 volts. NiMH batteries put out 1.2 volts per cell. Two of these batteries give you 2.4

volts. That's only .2 volts over the shutdown voltage. Thats why I used the alkalines for the external power (to get 3 volts). Perhaps I should use NiMH 'D' cells instead.
The down side to the etrex is that once it shuts down your done. It won't restart. I have been considering one of those GPS units that have no display or controls. You put power on it and they start up. The advantage would be that if your batteries become to cold and your GPS shuts down then when your batteries warm up the GPS would restart. Something to think about.

No - they are one time use cells. According to the documentation, the capacity is something like 2600mAH, but I think that's only for extremely low current draws. In practice, you can probably assume at least 2000mAH.

We've used the Energizer AA lithium cells on all three of our flights with excellent luck. You can find them at Wal-Mart for about $2.50 per cell. They usually hide them with the cigarettes because kids are making methanphetamine out of them.

2413. Energizer AA 1.5 volt lithiums

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-02 18:19:59 UTC
From: n1ltv
Topic: 2413 Message: 2413

Jeff,

What is unusual is that this lithium chemistry (Li/FeS2) creates 1.5 volts per cell. The usual lithium chemistries, both primary and secondary, make 3 volts per cell.

Only Eveready makes the 1.5 volt AA cells.

They're at KMART, too. Have been for at least a year.

Hank

I'm replying from work,so excuse the double post. Not sure
how to stop it. I figure members can use the delete key
finger. Its not that heavy anyway ;)

Mark
Thanks for your input here.
I think we have discussed using this GPS in at TVNSP.
I know i mentioned it,but price was the big issue.
You know how hams are, if it is cheap use it instead.
The etrex is tempting because of the $100 dollar price
range. The non-reinitialzing display units made me real
nervous. You would think with two on board we could
fool MR. Murphy.

I know now this is the one (or one of its brethern models
for my capsule).

While i have time on the inet;
I just want to say this has been a great discussion of
minds at the expense of a lost flight. This reminds me why
now we do we do these flights . For fun,learning and great
adventure. I'm like a sponge here absorbing as much as i
can. If we were all so smart individually,there would be
no need to experiment would there?

OEM boards are available for LESS than $100. Mark bought a
Motorola one. His favorite is the Garmin

There has been a guy on ebay selling unused but old Trimbles
for $35. Dozens of them. He just stopped because he couldn't
even get $35 for them after selling so many.

I asked if he'd consider a $20 or $25 starting price, since he
wasn't making any sales. (He declined, and then just quit a few
weeks ago. He may start up again.)

A guy on a list just sold a nice OEM board for $10. That went
fast so I missed it.

The point is, they're around, you just have to look for them and
then grab them.

My opinion is that handhelp GPS units are unfit for balloon primary
tracking and should not be used, period. TNNSP is the only group
I know of which does use them.

It has been really exciting to follow these threads in the group e-mails.

For those of you wasting tears over the flight, please accept this observation from an observer:

No one *ever* learned anything from an experiment that ran perfectly! The group has shown a wide spectrum of skill and intellect in solving the problems posed by this flight. These were not boo-boos in the usual sense of the word, but at least second order difficulties. It wouldn't have been any fun if everything had gone by the book. I bet the next flight will be better because of this one.

Randy has the right attitude.

Jim

2421. Re: Garmin GPS-35

Yahoo group: tvnsp (2000 — 2002)

From: Mark Conner
Topic: 2400 Message: 2421

As an aside, I don't think I'd use the Motorola on a primary beacon. Also, by the time you add on the antenna, RS-232 level converter (needed to program it), and other doodads, you're almost up to the ~$150 of the Garmin and have less performance.

The main reasons I got the Motorola Oncore M12, other than to try it out, was weight and power consumption. The Garmin requires about 130 mA at 5V (this from memory - actual figure in the archives somewhere). The Motorola uses about 80mA at 3.3V. The weight delta isn't that much, esp. by the time you put the Motorola in an enclosure. Also, since everything else needs 5V or more, I'm not really taking advantage of the Motorola's ability to use 3.3V.

The Motorola also defaults on power-up to binary data and no sentences enabled. The on-board backup battery will keep previous settings (incl. NMEA instead of binary output), but it's another failure point that would cause mission loss should power be cut and the backup battery doesn't work. The Garmin defaults to NMEA 4800 baud and GPGGA/GPRMC (among others) as output should it encounter a power loss with no backup battery.

The low-power mini GPS antenna performance is a bit weak. The Garmin will get a lock within two minutes in my house. The Motorola/mini antenna combo often will not lock at all inside. I'm not sure if a better antenna will improve its performance or not because I've been too cheap to find out.

One thing I did notice with NSTAR 02-B is that the Motorola/TT2 combo gave out frequent posits (20%?) with zero course and speed. The altitude appeared reasonable, but I need to correlate this with the primary beacon output to see if it was. I suspect this was probably due to a poor GPS lock, which is bad news. I may have to spend that money on a better antenna.

Bottom line is that I'd rather pay the extra $50-70 for the Garmin rather than N copies of the Motorola setup.

If I interpret what you mean by first order and second order difficulties, I disagree completely.

I think there were several unacceptable practices in the construction of this payload. Others on this list have communicated offlist that they share that general view.

This is essentially the second failure in a row of a tracking system on TVNSP. To continue in this same manner would perhaps be exciting, but it would also be folly.

Hank,

I went out Monday and drove around the Grand View area for several hours, got up on some high points and scoped out the area with binoculars, and I also distrubuted flyers at the Post Office, the only gas station, and several restuarants and bars around the town......the town isn't that big, probably under 1500 residents, so hopefully somebody will see the reward offer and turn it in.

I also told everyone on our morning net that it was out there, and a pilot that was flying over the area today said he and his passenger would keep an eye out for it.

Zack's "Jar" theory makes some sense too.

Tony,i have the exact same problem with my remote.
But mine does it with brand new batteries.
I used to reach into the battery compartment and just
roll the batteries slightly but got tired of that method.
Now i just give the unit a light rap in the palm of my hand.
I just figure i will take it back to "Wally World" if it fails
totally. Must be the cheap alloy springs they use not letting
the electrons line up properly? :)

That brings up another snafu and pet peeve of mine we might
look at. In my old days
of R/C flying,we always used nicads with solder tabs to make
series or parallel power connections. This was true for the
transmitter
and receiver. You simply did not trust spring clips to hold
batteries in compartments when flying or even car racing. Too much
chance for individual contact failure amongst several batteries.
You can imagine what would happen if a battery lost contact when
you are doing wild g-force maneuvers with the toys.

I actually had the battery compartment door on my tranmitter
open up when i dropped it on the ground. The battery pack fell
out but still held together dangling from the molex connector.
I was rather embarrased but the plane kept flying.

Not sure how the new R/C stuff is configured now days. I know the
cheapie R/C gear that started coming out in the 80's went to
battery compartments with spring contacts. I converted mine to
use nicads soldered and shrink wrapped together.
The more up to date R/C people might have more input on this.

My opinion, when you can solder your packs together it is
much more reliable and one less point of failure.
More spendy,but safer. I think we do that where possible.
Shame on us if we use spring loaded battery holders.

Great stuff everyone,just wished i could pop my $.02 in
a more timely manner.

WE ONLY USE THEM FOR ONE FLIGHT. However there is usually plenty of extra life in them for things like remotes, clocks, and other non-life-threatening devices. After out last flight, I've been using the left over lithium's for testing and have had a good six hours or so of additional life at room temperature - plenty of time to find a capsule laying on the ground that take a while to get to.

Mike,

My photos of the stack were taken earlier and did not show the backup beacon antenna. (Photos attached.) I do have video clips of the launch, but they are at a distance and did not capture much detail.

Dan KD7MVO

We have been using a 6 cell AA clip-in-holder for our lithium packs, however I noticed after it's first flight that the plastic sides (the part that the spring pushes against) had bowed back slightly from the constant pressure. We now use electrical tape around the pack in all directions to hold everything tight and apply constant pressure.

Topic: 2428 Message: 2433

Mike
You will not need the HSP cable for you KPC3+. It is only needed for older tnc's that are used with laptops that have only one serial port. It was a clunky way of sharing the gps and radio on one port. The radio and gps can use the DB-9 on the psuedo serial port of the KPC3+. This leaves the DB-25 port free for the laptop.
I'm not familiar with the pin-out number of your gps so i will not use numbers for it.

GPS DB-9(kpc3+)
Data in----pin 3 (optional if your gps accepts data)
Data out---pin 2
GND--------pin 6
Power------pin 7 (optional 12V pwr.source for gps)

If you use pin 7 to power your gps,you will have to change a jumper inside the tnc. This pin is hot all the time so be careful. Smoke damage not insured, going off my documented notes.
Another confirmation is always good. My dyslexia sometimes kicks in inadvertantly.

I will let Stephanie strangle you with the HSP cable ;)

Your no dummy,just eager to learn.

From: Zack Clobes
Topic: 2434 Message: 2434

I just found an unusual problem on my controller board. I've been getting it ready for a school presentation in the morning and for some reason, my VX-1R was having a problem staying keyed. It would start to transmit and then drop carrier one or more times per packet. I've occasionally seen this problem on the bench with high-RF field or on a noisy power supply but never this bad. I finally replaced my 3.3k pull-down resistor (for PTT) with a 1k and things are working much better.

This was the controller that just flew without incident a couple weeks ago. I'm not sure exactly why it suddenly started having problems - the resistor measured about 3250 ohms... well within spec.

Mark is right. I own a Garmin GPS-35 and it is trouble free. You just give it power, over a VERY wide voltage range, and it just works. Its even waterproof. Its made to permanently mount on a vehicle like a car or boat. I know people that have these permanently mounted on their cars for years with no problem. Well worth the money. They must have gone up in price a bit. I don't think I paid quite that much for mine when I bought it about a year ago.

I was out there last night looking around for several hours.
surprisingly heavily populated...
all farm land / cattle land....
very hilly... not suitable for searching by car.

we are going back wed night... going to get on a bluff and use some
binoculars.
Don't expect to find much....

we are going to leave work early and get out there around 2pm ish...

there are a couple of buttes you can get up pretty easy with 4WD,
try to have a look around...

but by AIR is really the best way to do this.... by far.....
when driving you can see maybe 20% of the land it's so bumpy.

The "high-voltage" version takes 6-40V and the "low-voltage" version takes 3.6-6.0V. I got the low-voltage version and feed it off a regulator. I also wired it to be pin-compatible with the various Tripmate adapters for lighter sockets or laptops (they put out 5 to 6V).

I have a GPS 3+ like yours Randy, sounds like a good project to bring to the next construction meeting!

Thanks!

From: Stephanie Steele
Topic: 2442 Message: 2442

Hi Group,

I have somewhat quietly lurked as the discussion has gone on regarding what happened to this flight. I worked up a theory that, once Paul supplied me with the power source information, seems to be an obvious one. I am sure I am not the first to think of this (I'm sure) but I don't recall anyone stating it as I will here.

Here goes:

It is my theory that both trackers stopped due to power loss. We know this is true of the main system due to the telemetry that was received prior to it's demise. I suggest that the second tracker continued to function until it lost it's ability to transmit due to power loss in the radio while the GPS continued to function normally. I believe that the GPS continued to function as it's voltage continued to drop. I suggest that then the batteries in the radio recovered (alkaline batteries will often 'bounce back when load is removed from them as they near total discharge) just enough for one final packet to be generated by the TT just prior to the batteries in the GPS dipping below the low voltage threshold required for it's continued operation. This sequence may have been made worse by the low mass of the recovery beacon capsule and it's attendant higher susceptibility to thermal loss. I believe the radio continued to cycle as it's voltage rose and fell below that required for it to transmit. I think this explains the two widely separated garbled packets I saw and that were accompanied by extremely weak packet audio. I was listening with a very high gain narrow beam width beam (my Mode B satellite antenna) that was aimed precisely at the last known location of the balloon and I am confident that what I heard and saw on the raw data was junk coming from the recovery tracker.

I suggest that the excess RF theory is implausible due to the loss of the primary transmitter. Once it died there was no reason for RF to continue to be an issue with the TT if it ever was. I also discount the possibility of a collision with an aircraft as our equipment would have been sufficient to have generated some type of damage to that aircraft which would have been made public by now. Further, I don't believe there was any type of 'jerk' that caused the battery to regain contact as the flight data suggests that the balloon was still rising at it's last report (correct me if I'm wrong on this point but I felt that this point was pretty well established).

We have learned from prior flights and testing that Jeff performed following last year's losses, that the weak link in our design is our power source. I will agree that using consumer grade GPS receivers places some risk of failure into the mix but, as has been demonstrated, with adequate power from fresh sources, and of a design that is resistant to the effects of the cold, these receivers will work adequately. Jeff's successful re-configuration of his power sources following the Twin Falls flight, where it was clear that the GPS shut down from the effect of cold upon the alkaline batteries in the GPS, clearly demonstrate that the Etrex and other similar consumer grade GPS receivers will perform fine as long as they have adequate protection from the cold AND sufficient power sources. His use of two power sources to feed the GPS on subsequent flights has proved successful and removes the single point of failure that is a part of much of our design.

In summary, I believe that cold, coupled with use of temperature sensitive alkaline batteries, were the cause of the failures. Can't prove any of this until we find the capsule, but I believe this is a plausible explanation. The solutions are simple. Fly non temperature sensitive batteries in a redundant configuration and of sufficient voltage to compensate for the predictable loss of capacity from the cold.

Just my .02 worth. Hope this at least spurs some consideration and discussion. I know, I know, shut up and get back in the kitchen. ;-)

Stephanie

verhap@... wrote:

Thanks Paul. What was the power source for each component?
Was the Etrex dual powered or only internal. What battery type
was used for each? Thanks!

The TT had it's own 9V alkaline. The Etrex was only internally
powered, and those where alkalines. The HT also used alkalines.

Paul

>system on TVNSP.

Did I miss a flight? TV01H was well tracked right into the darn power line. TV02A was the next flight.

I'll certainly agree that the tracking systems need a more rigorous test before the next flight. I'd really like to explore why the MIM gets out so much worse than the TinyTrak or Jeff's KPC3+. On the previous flight (TV01H) I captured loads more packets from Jeff's KPC3+ both in the chase vehicle and from my home station. AFAIK I got NO packets from the MIM on this (TV02A) flight at my home station. I got around 12 packets from the TinyTrak, which I believe had a lower power transmitter on it.

I mentioned it on the air from the soccer game on Saturday, (Sorry about my low audio there - I wasn't exactly in a prime location and was on an HT. Even at high power I had to stand in a different location to be heard.) but I think there is a good opportunity for a field exercise. A number of local hams do APRS support for the HP Women's Challenge Bicycle race. We've had some message acking issues that we would like to test out prior to this years race. TVNSP has some balloon trackers to test out. It seems like a good fit to test both at the same time.

At 11:10 PM 4/2/02 -0700, you wrote:
>It is my theory that both trackers stopped due to power loss.

This seems reasonable to me.

>I believe that the GPS continued to function as it's voltage continued to
>drop.

This seems reasonable as well. By default (it is changeable) the TinyTrak2 will ONLY transmit a position if the GPS is indicating that it has a valid lock.

>This sequence may have been made worse by the low mass of the recovery
>beacon capsule and it's attendant higher susceptibility to thermal loss.

I'm not sure on this aspect. If the recovery beacon capsule is constructed the way I believe it is based on observation at one of the meetings it has as much or more insulation as the normal capsule does. I don't know how well sealed to air it was, so that could still be a factor.

>I suggest that the excess RF theory is implausible due to the loss of the
>primary transmitter. Once it died there was no reason for RF to continue
>to be an issue with the TT if it ever was.

It does seem odd. I know I've occasionally seen reference to an RF issue with the TT, but I've used mine extensively with only two possible instances of RF interference. One turned out to be a cable problem and the other is likely the same problem. Both were with an older radio that I don't usually use it with.

Personally I'm with Stephanie - I don't think it was an issue of RF hosing the TT. I don't believe it would have recovered for that last packet we did get if that had been the case. I'll also argue that most newer radios have a transmission time out timer and would have unkeyed in plenty of time for us to see signals from the flight computer.

Paul - what radio was on the backup beacon and does it have a transmission time out?

>I also discount the possibility of a collision with an aircraft as our
>equipment would have been sufficient to have generated some type of damage
>to that aircraft which would have been made public by now.

No argument there. If nothing else that lone packet at 77k feet is a good indication that that didn't happen.

>We have learned from prior flights and testing that Jeff performed
>following last year's losses, that the weak link in our design is our

>power source.

It does seem that way. Based on what I read of the re-engineering of power sources I would suggest that we need to take an additional step of powering the transmitters separately from the more constant load of the flight electronics. Further I'd suggest that we have to run a minimum of one ground test for as long as the batteries will last to verify the length of time we should expect.

>I know, I know, shut up and get back in the kitchen. ;-)

Not gonna hear that from me!

Bill

>AFAIK I got NO packets from the MIM on this (TV02A) flight at my home station.

Let me rephrase that as: no valid position packets from the MIM.

In reviewing the raw TNC data I do see packets from the MIM. However, they aren't fully formed packets and APRS+ was not displaying them at ALL. (I was running 2.10 at the time of the flight.)

What should the GPS fix packets look like? I see some that do not seem to have a position in them but have the "GPS Fix" text and some that do seem to have a position content with that text.

I'll try to upload the raw log later this week. I started it just after the flight started and didn't stop it till late that night as we had a mildly jam packed Saturday. It's got a lot of non-pertinent data in it and is HUGE! (Yes, I'll strip it down first.)

The 1200 fpm descent we use is for the old parachute. I looked at TV01H last night and calculated that it landed at 600 to 700 fpm. John, can you run a prediction for that descent speed?

Tonight I'll look at the relationship between burst point and landing point.

Just my .02 worth. Hope this at least spurs some consideration and discussion. I know, I know, shut up and get back in the kitchen. ;-)

I see nothing wrong with Stephanie's hypothesis. Past flights used military surplus lithiums. I stopped using them because they're becoming rarer and more expensive. Also, there have been some problems with them due to their age. So Stephanie, you're not banished to the kitchen.

I checked Walmart last night. They sell 1.5V lithiums at the camera counter in Caldwell.

Using a 6.0V power supply is not a problem as long as you have the capacity. 1.5 A-hrs is suffcient capacity for the flight computer. I'd like to try a 7.2V RC battery, but it is nicad (but they're cheaper in the long run and readily available). A warmbox may be all they need.

I've ordered another GPS, servo controller, cable for my Vertex HT, and some crimped coax cables. I have another TT and MIM at home, ready to be used as a flight computer. I'll order a BS2p today. Stephanie, the coax should work as DJ-S11 coax, we'll cut one in half and try it out at a construction meeting. I've also started building a new airframe. I have yet to order a DJ-S11. I have a DJ-S41, which is the 440 version. Can anyone track on 440? Mike, I think you said you could.

If Jeff would like to launch his tracker, we could make an April 20th launch. I'll make a 1/2 scale capsule ready (the one for the May high altitude attempt) with a camera. Jeff, let me know. I'll put the TT into the second module along with lithium AAs and a lithium 9V.

If nothing else, this has added another chapter and a half to my book.

Mike, will you be able to get an article to ATVQ? Perhaps someone would like to write an article on what we are discussing about this flight?

Paul

Both use a DJ-S11. I'm not aware there is a trransmission time-
out. The documentation for this radio is only one page long.

The HT and flight computer are different batteries, as are the servos.

The MIM sent two types of packets. The most common was the
telemetry. Those were sent once every two minutes and are
generated by the MIM. The other ones are generated by the flight
computer and then sent to the MIM. The flight computer then
forces a posit by bringing the A3 line low. These packets are the
GPS data.

The GPS data will look like this...

$GPGGA,.....
$GPRMC,.....

Hi Paul,

If you are going to get some coax, and still want to mod the radios, go ahead. You can use one of them for the upcomming flight(s). I was under the impression that you would have any coax. If that won't work then I'll try and get some of the stuff (I can't recall the type number) you had before which I have found is normally stocked by Mobex.

Paul,

I'm still crunching numbers on this landing spot calculation.

Could you post the chute diameter and payload weight? I think
the weight was approximately 12 1/2 or 13 pounds, but it's
worth confirming.

I'll be posting calculated wind speeds and wind directions
today since I've had time to double check what was done
Saturday night and it's okay.

I had an idea that the descent speed might be off, but never
expected it to be that far off.

Hank

Is the descent speed the landing speed? The landing speed must be the slowest speed of the descent phase. What about the higher descent speeds at higher altitudes?

Batteries America is an excellent source of NiMH cells if you want to make custom packs. Their web site is http://www.batteriesamerica.com. They have detailed information on capacity, size, and weight for each cell they carry. The best power density by weight is the 4000 mAH cell I use - they're about $7 each, or $42 for a 6-cell pack. If you get them, make sure they have solder tabs on them.

Many R/C chargers will handle NiMH packs, but check the manual to be sure. The end of charge detection method is different for NiMH vs NiCD. I use a R/C charger that I bought from Tower Hobbies. I used to use a Maha charger, but it didn't get the batteries to full capacity. The charger I got was about $70, but I use it to charge all my NiCD and NiMH batteries (incl. AAs for my digital camera).

Parachute diameter is 7 feet. The porosity of this 'chute is evidently less than the old 'chute. The total weight, including parachute is 13 pounds as I recall.

Since I didn't share the idea with the group here it
is. Thanks Paul

With all the comments being made I have a suggestion
that might solve several problems at one time. If I
remember correctly, the April launch is to be in
conjunction with DCI. Why not do the suspension test
at DCI? We could wait until the Center opens, fill the
balloon, suspend it in the air several hundred feet
off the ground, demonstrate APRS on a different
frequency, and could also use the SSTV with another
receiver on the ground. Suspend it during the hours
DCI is open.

A thought.

Also, how will this affect the demo we wanted to do
with the Scouts on April 13? Should I not plan on
anything, just announce about DCI and go from there? I
still plan on a APRS set-up which I will do.

If you get a chance, go see comet Ikeya-Zhang. I saw it Monday night with and without binoculars. Its located in the northeast. Wait at least an hour after sunset. Over the next few nights it will drift past Andromeda Galaxy. In binocs you'll see both objects, with the comet being brighter.

Check

I'm finally getting caught up on the TVNSP stuff after being offline a week. 247 posts took some wading through, and I had to put it off, giving priority to other things.

I'm aware of at least one proposed airborne capsule SAR pending. Hopefully, it will locate the lost capsules. A piece of information I need to pass on for this is, what is the 'chute diameter and what are the colors?

The time has come, I think, to re-suggest an idea I offered shortly after linking up with TVNSP. I still believe, and this loss reinforces that belief, that there should be a TVNSP equivalent of a triggerable EPIRB. This should be something that does not run constantly during the flight, is completely self-contained and epoxied, and is triggerable by a search party. My original thought was that it should not run at all until it hits ground, but discussion with another person has led me to consider that it might be worth having it run at widely separated intervals. I'm still not sure of that point, though.

The idea is that this device has nothing to contribute at all to data collection or flight sampling. It is purely a recovery device, triggerable by a pulse from searchers. Airborne searchers could get into the general area rapidly and reduce the terrain to be searched by DF techniques. Once the area is narrowed down, then ground parties can move into the indicated location, if the capsules and 'chute aren't visible from the air. This would reduce the ground team's work to simple DF as with a fox hunt.

This device should be simple, transmitting a pulsed signal similar to that for CW on demand. Whether or not it should beacon regularly after landing is debatable, my feeling is that it should not do so, in order to preserve battery power for the actual search needs.

I have developed a beacon similiar to that. The problem is the
weight. I need a cheap and light radio.

I'm not sure we're thinking the same way. Your reply below indicates you attach the beacon to a radio. I'm talking about a completely self-contained beacon, for example like the CW radio you'd build in a tuna fish can. This whole thing would be epoxied for protection from the environment, the weak link being the antenna connector and the battery connection, though those could be completely enclosed in thermal protection of some sort. There are RF chips out there that should enable us to have a simple radio-in-a-chip design for the beacon.

2466. Backup transmitter/Garmin 35 GPS engine

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-03 19:50:33 UTC
From: Zack Clobes
Topic: 2466 Message: 2466

We are just beginning to start development on a small, low power 2m transmitter that we hope to be able to build for under $50. It is based on the Motorola MC2833 (I've got a spec sheet if anyone needs it). The chip I believe has been discontinued but can still be purchased from www.oselectronics.com among others.

Secondly, we checked on Garmin 35-HVS/LVS units today. They can be purchased directly from Garmin (with a credit card) for $135/$130 respectively. However, they said that the HVS units are backordered into August.

2467. Locator beacon

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-03 19:53:53 UTC
From: n1ltv
Topic: 2442 Message: 2467

The locator beacon can be made from ONE off the shelf component as the RF generator: a simple clock oscillator.

Now before you scoff, look up around April or May 2001 in QST magazine and you'll see how Pierre Thompson's balloon payload that landed near ARRL headquarters was located by RDFing on just such a signal.

This payload was the main transmitter and was never intended to be used long after landing, but because of its small current consumption, and because Pierre uses PIC microcontrollers (no power hungry BASIC Stamps) there was less than one milliampere current drain from his 9 volt lithium battery for the controller.

This assembly lasted about a WEEK sending CW telemetry at one minute intervals that gave an ID and also temperature and battery state telemetry.

The CW was heard for over a 20 mile radius on 10 meters and the final location was done on a 2 meter harmonic using handheld beams just as the beacon was about to run out of juice.

It's a great article in QST and has lots of pictures. It was a great pleasure for me to have been a participant in that recovery, starting with the alert I sent Steve Ford, QST editor, the day before Pierre launched telling Steve that the balloon might land close to Steve's home and that he might want to give a listen.

He did, he heard, and later he wrote. Steve also was instrumental in gathering ARRL troops to locate the beacon. The fact that the CW on 10 meters was heard over a good chunk of Connecticut made it a little harder to figure out where the payload was. It turned out to be snagged high in a tree on high ground, so that helped the propagation.

Hank

That seems about right, given some schematics I dimly remember. My only question here would be to ask, how much would it complicate things to move it to 2m instead of 10m, and dump it into the low end of the 2m band? 2m would help localize it more, plus have the advantage of requiring a smaller antenna, I think? I still believe that for this recovery beacon, it should be triggerable rather than just sit there beaconing away.

I don't get QST, but I'm going to ask around and see if anyone has a copy I can check out.

Zack,
Garmin's gps36 unit is identical to the 35 with two exceptions -- its white and comes with a 30 foot cable instead of 15. It's intended for marine applications. You might check on availability of that model too....They've also come out with a new gps17 model that weighs a bit more, but is WAAS capable, bringing the EPE down to about 3 meters. If I remember correctly, the 17 is around $170.

MY $.02 worth.....

2474. Receiver current

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-03 21:08:19 UTC
From: Mark Conner
Topic: 2474 Message: 2474

The problems I see with having a triggerable beacon is that significant battery current is needed to drive the receiver. The receiver ends up eating as much or more of the battery than the transmitter would on a low duty cycle. Another is that the antenna has to pick up the command signal.

Testing should be done to see if the batteries will live longer by transmitting periodically and having no receive capability, or including the receiver (perhaps with some sort of power-saving circuitry) and a commandable beacon.

One of the reasons I decided on an APRS-compatible backup was because we have no experienced DFers in our group, or good mobile DF equipment. To me, it was better to have something to switch to in mid-flight that was APRS compatible rather than trying to find a non-directional beacon either during or after the flight. Even if the balloon went over the radio horizon on us during the chase, we could get within a few miles and then just drive around until we picked up posits on the ground.

I hope to eventually have a backup APRS beacon that will run 36 hours or so. That way if the worst happened and we couldn't find it with a ground search on Day 1, we could do an aerial search with a D7 on Day 2 and hopefully pick it up. This would require about 5000 mAH at 6V with my present setup.

From: Zack Clobes
Topic: 2474 Message: 2475

I agree with Mark on the commandable backup beacon not being that great of an idea, but I'd also have to add that having a receiver with some sort of monitoring capability is just that many more things to go wrong. Remember: KISS

We have a 29.?MHz TTL oscillator coupled into a 2m dipole that we key on and off with a 555 oscillator. It works pretty good. With a lithium 9V from Radio Shack, it will transmit for a week solid (I know because I forgot to unplug it after our last flight - once the batteries start to die, it has a bit of a sweep oscillator effect.. :-/)

We have had some bad luck with it though - the first flight our 555 timer literally cracked in half. When I was getting ready for the 3rd flight, I had to replace the TTL oscillator because it had died. Kinda weird.

The transmitter I made uses the fifth harmonic from a clock crystal.
It's very low power, which is why I never used them seriously.

> We have a 29.?MHz TTL oscillator coupled into a 2m dipole that
we key on and off with a 555 oscillator.

That's the fireball transmitter I built. It's a milliwatt transmitter. I
didn't like be because of the low power. KNSP flight 98B used one
as a backup. We chased home electronics trying to find the
capsule. It's frequency and output sounded a lot like home
electronics noise.

The 555 just keys the transmitter, it's just a dead carrier. I'd like to
send CW over a more powerful version.

The design I had in mind uses a more powerful transmitter encased
in a tetrahedron. At each vertex is an antenna element and each
face is covered in a PV array. It's made to drop off a boom and
hang by a tether after the balloon bursts. No matter how it lands,
there's solar cells exposed to the sun. It basically sits on three
antenna elements with the fourth sticking straight up.

I looked at the RFM site. I didn't see transmitters in the 2m band.

2479. Radar Logs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-04 00:04:53 UTC
From: Tony Barrett
Topic: 2479 Message: 2479

Hey everybody,

Kurt Larson was saying that the military and the FAA often keep radar logs for a few days in case some plane turns up missing. These logs may be available on the internet. Do you think our balloon would show up in these logs? We know where it was at 8:06 AM Saturday morning, 77,000 feet above Swan Falls, and it wasn't far from Mountain Home AFB. I'll bet they could see it on their radar unless they don't scan this high.

Sounds like they only keep these logs for a few days, so if we want to pursue something like this we'd better jump fast.

Best regards,

Tony

I love the triggerable idea, because then a dog collar (for example)
could be built with a lithium battery and just idle for a long time...
low maintenance....

Subject: RE: [tvnsp] Locator beacon

That seems about right, given some schematics I dimly remember. My only
question here would be to ask, how much would it complicate things to move
it to 2m instead of 10m, and dump it into the low end of the 2m band? 2m
would help localize it more, plus have the advantage of requiring a smaller
antenna, I think? I still believe that for this recovery beacon, it should
be triggerable rather than just sit there beaconing away.

I don't get QST, but I'm going to ask around and see if anyone has a copy I
can check out.

2481. RE: [tvnsp] Receiver current

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-04 00:34:20 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2474 Message: 2481

To my surprise....you are correct!
If you beaconed 10 seconds every 3 minutes you
would use 1/3 the power of running the RFM receiver.

With the RFM part,
when receiving it uses uses 1.8mA
while transmitting 12mA

receiving for 24 hours would use 43mA

If there were no receiver you could transmit for
3.6 hours with this much power. (rx uses 15% of
the power used for TX).

contrasted with:

a 10 second transmission every 3 minutes would use
= 200 seconds / hour duty cycle
= 200*24 seconds / day duty cycle
= 80 minutes of TX

-----Original Message-----
From: Mark Conner [mailto:n9xtn@...]

Subject: [tvnsp] Receiver current

The problems I see with having a triggerable beacon is that significant
battery current is needed to drive the receiver. The receiver ends up
eating as much or more of the battery than the transmitter would on a
low duty cycle. Another is that the antenna has to pick up the command
signal.

Testing should be done to see if the batteries will live longer by
transmitting periodically and having no receive capability, or
including the receiver (perhaps with some sort of power-saving
circuitry) and a commandable beacon.

One of the reasons I decided on an APRS-compatible backup was because
we have no experienced DFers in our group, or good mobile DF
equipment. To me, it was better to have something to switch to in mid-
flight that was APRS compatible rather than trying to find a non-
directional beacon either during or after the flight. Even if the
balloon went over the radio horizon on us during the chase, we could
get within a few miles and then just drive around until we picked up
posits on the ground.

I hope to eventually have a backup APRS beacon that will run 36 hours or so. That way if the worst happened and we couldn't find it with a ground search on Day 1, we could do an aerial search with a D7 on Day 2 and hopefully pick it up. This would require about 5000 mAH at 6V with my present setup.

2488. Attached and unwanted jpeg files

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-04 05:53:40 UTC
From: n1ltv
Topic: 2488 Message: 2488

Could someone try to figure out what these jpeg
files that Tony keeps sending out are?

On tonight's messages from Tony KNSP #2483 had a 37k,
#2484 had a 78k, and #2485 was clean.

He's been sending these out for months, and sometimes
they're over 100k in size. I wrote to him a few nights
about it, but I don't think he knows what if anything
can be done about it. Over the three months I checked,
it looks like about 85% of his messages have these
attachments.

I can't see anything recognizable in them.

Hank

Tony,

The balloon and capsules do not reflect enough energy to be seen on radar. In fact the Cheif Inspector where I work (Western Aircraft) owns a small plane that is fabric coated. As large as it is (compared to our capsules) the tower has great difficulty finding him. He has to describe exactly where he is for the tower to be able to find him. As far as radar's go our capsule's are invisible.

2490. Re: [tvnsp] Receiver current

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-04 15:22:25 UTC
From: John Knapp
Topic: 2474 Message: 2490

When I starting chasing balloons, the capsule had a beacon that broadcasted every two minutes. We would pick up the beacon, and two minutes later we were far enough down the road where we couldn't pick it up again. This was the capsule that was lost North of Hailey, Id. in the mountains. Even on the flats, a beacon of every two minutes could mean you could miss the signal or drive right past it. I couldn't imagine what would happen if you only had one every half hour.

We decided to have a beacon every 30 seconds, it would be easier to follow.

One thing I have noticed about these emails. I believe some of the writers do not appreciate the terrain we have to search in. There are very few very flat areas. Even what I call flat can have canyons and hills in it. The area where we searched last Saturday had gulleys and hills that prevented an unobstructed view in any direction. It is possible the capsule could land in gulley or behind a hill and not be readily seen from a road or trail (even a hiking trail).

I'm appreciating the terrain as best I can by looking
it over on a Garmin computer topo map, but it would be
nice if someone would be able to take a few pictures of
a search area to upload to the TVNSP files area.

I'd especially like to see some classic butte coverage. :)

With these low power beacons being discussed, they're of
great value for airborne searches. If you get a signal,
at least you know your payload has not sunk in a pond, and
the airplane, even if it doesn't sight the payload, might be
able to localize somewhat for the dispatch of a land search.

The Connecticut terrain which was the subject of the April
2001 balloon recovery story was by no means flat.

Hank

> seen from a road or trail (even a hiking trail).

I'm appreciating the terrain as best I can by looking
it over on a Garmin computer topo map, but it would be
nice if someone would be able to take a few pictures of
a search area to upload to the TVNSP files area.

I'd especially like to see some classic butte coverage. :)

With these low power beacons being discussed, they're of
great value for airborne searches. If you get a signal,
at least you know your payload has not sunk in a pond, and
the airplane, even if it doesn't sight the payload, might be
able to localize somewhat for the dispatch of a land search.

The Connecticut terrain which was the subject of the April
2001 balloon recovery story was by no means flat.

Hank

Be aware, too, that even if you can get a Lat/Long GPS reading from the flight search, you may well need to do some careful study of the area maps and make your own road into where the package landed. I have driven from Swan Falls to Grandview cross country on the north side. If you must, you can follow the power line in and over to the rim, and usually find a way down from there to the lower area between cliffs and river. You may not be able to get down right above the package. You can also access the lower area directly from the highway between Mountain Home and Grandview, but I seriously doubt you can run the whole area that way. A brief look at the time seemed to indicate the area east of this highway is similar.

2497. Any new landing positions?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-04 19:03:12 UTC
From: kd7pit
Topic: 2497 Message: 2497

I was wondering if anyone has any new info as to where the capsules might have landed using the new descent rate. I was thinking about going out this weekend if time & weather allows and do some mt. biking with my girlfriend and Ben. If someone can give a lat & long of the burst AND possible landing, I can load that as waypoints on my GPS and ride around and between thoses points. Maybe get into areas that vehicles can not. Thanks.

I can do 440,but i would think 2M is better for our
terrain.
Just thinking when the capsule lands it is nice to have the
best chance for good RF range. If we were flat landers,i
might consider 440. ;)

I'll have something later today. The careful reconstruction
of the winds up to 23k feet and getting all the facts straight
about this flight has taken considerable time. I think I might
have discovered some small inaccuracies in BallTrack.

The file I uploaded for the Saturday 12 UTC winds was actually
for a later time, so that needs to be fixed, too.

We are just beginning to start development on a small, low power 2m transmitter that we hope to be able to build for under $50. It is based on the Motorola MC2833 (I've got a spec sheet if anyone needs it). The chip I believe has been discontinued but can still be purchased from www.oselectronics.com among others.

Secondly, we checked on Garmin 35-HVS/LVS units today. They can be purchased directly from Garmin (with a credit card) for $135/$130 respectively. However, they said that the HVS units are backordered into August.

That's correct.

I changed "receiver current" caption to "beacons
and terrain" in order to more accurately reflect
the topic.

Another thing which is cropping up is replies that
quite *several layers" of old messages. Please
don't do this.

It only takes a second to trim that junk off. True,
it doesn't take long to scroll through the junk,
but sometimes a valid post will have *new* comments
embedded in the old stuff.

That means that if you want to not miss something
you have to wade through the junk to see if something
new is embedded in it by a careless poster.

20th launch. I'll make a 1/2 scale capsule ready (the one
for the
May high altitude attempt) with a camera. Jeff, let me
know. I'll
put the TT into the second module along with lithium AAs and
a
lithium 9V.

Paul,

I don't think I can be ready for a flight that quickly. I need to make some changes to my capsule. I'm going to buy the Garmin 35 and replace the Etrex. I've had the Etrex shut down on me when using it to track my wife's car on a trip to Salt Lake City. I no longer trust it. In addition I'm going to remove the video camera and add a backup beacon. I'm also going to use batteries with more capacity. After I add the new items and build the new wiring harness I need time to test the package. For these reasons it would be to difficult to commit to a launch date. We can discuss the details at the next TVNSP meeting this Sunday.

I have been receiving them lately also. The one message that I looked at did look something like SSTV (some garbled picture with a line through it) and the second was considerably smaller and didn't appear to be in JPG format (or clear text for that matter). My virus scanner didn't mark them as being fishy or anything though.

Randy,

Those message numbers refer to the knsp yahoogroups
website. Please check

http://www.yahoogroups.com <http://www.yahoogroups.com/>

at the TVNSP area, and you'll see dozens of emails from Tony
that have attachments as big as 120k bytes.

Now others on list are mnetioning they indeed have been
getting them.

Hank

Ok, i see them (opened my other good eye). I usually ignore
attachments unless they are referred to by the sender. No biggy i
thought.

I Just figured it was something Yahoo was doing to further enhance
their advertisement prowess. I noticed at the end of David's post
Yahoo is mentioned each time with a sales pitch. I just wrote it off
as a Yahoo thing since they are our sponsor. This is my first long
association with them through this group. I have shyed away from the
big "Y" in the past because i did not like so many pop up's from them.

Getting off topic here so thanks. Back to ballooning.

PS Sorry Tony,Just noticed i mispelled your name on the initial reply
to Hank. You can call me Randi :)

>their advertisement prowess.

To the best of my knowledge it is. It's worse on some messages because of the format they're sent in. If a given message is sent as "plain text" the attached advertisement is also plain text. If it is sent as HTML or other format then the attached advertisement includes graphics and is MUCH bigger.

The people who aren't seeing the bigger messages probably have their Yahoo profile set to only receive plain text messages so they see the plain text version which is smaller. Those seeing it either have left their Yahoo profile at the default (allow all message formats) or like me don't have a Yahoo profile.

The best solution is for all of us to make sure to send plain text messages only. Unfortunately, some mail clients (especially Microsoft ones) make that difficult. Microsoft made a very poor choice for the default message format. Worse yet, even if you change it the darn programs use whatever format the original message was in if you reply to a message.

As a listowner (I help run an 1100+ member list) I can tell you firsthand that HTML format is a terrible choice. A message such as this one would be 3 to 5 times larger if I were to send it in HTML format even if I did NO special formatting whatsoever. Not only does it include some really poorly optimized HTML but it also contains 2 complete copies of the message. (one in plain text and one in HTML.) Personally, we not only banned HTML on our list, but we put an automated filter in place to stop messages that contain it from reaching the list.

All of us can do our part by (a) making sure our mail client is set to send plain text and (b) making sure any answer we send is in plain text.

Note: You can find details on switching your message format at
http://helpdesk.rootsweb.com/listadmins/plaintext.html

Radar reflectors that would light up a radar scope like a Christmas tree
are cheap and easy to build, totally passive, and don't weigh much. Seems
like cheap insurance. I recommend we make it SOP to never launch without
one.

2517. Re: [tvnsp] Radar Logs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-05 05:12:20 UTC
From: Mark Conner
Topic: 2479 Message: 2517

Does anybody know that even if a reflector provide enough energy to make a primary return on the radar, would the FAA be willing to provide any tracking information to help with recovery? My guess is that it would cost the FAA close to the equivalent of the payload's cost in terms of labor, etc., to get the data, run it back through a system that can review it, figure out which blip to track, and follow it to the end of the flight. I'm not sure if they'd do it unless there was some safety issue involved. Maybe there's more automation to the process than I think there is, but a lot of the FAA stuff is 70s or early 80s vintage at best.

A lot of the Internet stuff available is based on ACARS, not FAA tracking data. If there's no transponder, I think the FAA's process would be rather labor-intensive.

2518. Improved landing zone estimate with maps

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-05 07:56:54 UTC
From: Hank Riley
Topic: 2518 Message: 2518
Attachments: 2 described; binary payloads are missing from this source WARC

This shows my current guess for a landing zone. It's a zone rather than a spot because there are so many unknowns.

This is based on a corrected composite wind file, but the main thing to notice is that the descent speed of the parachute makes a huge difference. It's more important than burst altitude. So the landing zone is longer than it is wide.

The three earlier points from Sunday's prediction are noted even though they were based on a faulty descent speed of 1400 feet/minute and being placed a little too far west. This result is very similar to the one posted by John S., so using the refined composite wind file didn't make a whole lot of difference. Using the correct parachute speed did.

The three new reference spots, all in the Strike Reservoir area, are as follows (from north to south):

1200 ft/minute, 80k burst 42.98 north, 115.97 west

1200 ft/minute, 85k burst 42.96 north, 115.93 west

1000 ft/minute, 85k burst 42.91 north, 115.86 west

I agree, I think the FAA is going to ignore it. Putting a reflector on the balloon gives us nothing unless the FAA asks for it (as in flying heavier payloads).

Hank, I can't read the text on your GIF, I see blank circles.

After classes yesterday I checked my phone messages. I had a voice mail. Not to get your hopes too high, but the caller said the following....

"Paul, I think I found your balloon. It got run over by a tractor, so it's not in the best shape. I'm at work right now"

The person did not leave a name or phone number. I have no idea if this is our balloon or a NWS balloon. I haven't recieved a second call yet. I must of accidently deleted the message rather than saving it.

Mike, did you post my name and phone numbers with your posters or your's? Hank, can I get a new GIF? I'd like to find out which predicted landing spot is near a farm (perhaps they all are).

Paul

Topic: 2518 Message: 2528

> Hank, I can't read the text on your GIF, I see blank
> circles.

Paul,

I'm viewing both maps perfectly from the yahoogroups
website using a public computer, so I think if you
try viewing the maps that way you'll be okay.

If not, I'd suggest downloading an external image view
program and trying that; or trying someone else's
computer at school.

Due to a family emergency, I not as able as usual to
resend files or explore this further right now, but in
this case the maps are visible on at least one other
computer besides my own.

The landing zone is essentially the area of land enclosed
by the omega (inverted U) formation of the Strike Reservoir
and the bend in the Snake River. The zone I've depicted
lies a little closer to the left side of the omega than
dead center, and runs roughly the length of the omega.

If you need to, you can check one of the web topo sites
such as http://www.topozone.com

913-397-8200 and ask for their Avionics dept.

I just ordered another one this morning, however the prices I posted earlier were apparently dealer prices because the lady I talked to couldn't find those prices anywhere. I paid $150 for the 35-LVC which is the only model (between the HVS, LVS, and LVC - I didn't investigate the other two because I'm not as familiar with them) that they have in stock.

From: n1ltv
Topic: 2518 Message: 2538

Paul,

Could you give me some feedback about whether you've been
able to view the maps?

I've gotten email from people indicating they can see them
both fine. The fact that I saw them from the website shows that
there was no problem with the mailing from here to yahoo.

Hank

This seems to be a caller who got Paul's name from
one of the posters, or else he would have had to have
gotten Paul's name and number from the payload itself,
in which case he'd have to be pretty certain that he
had the balloon and not be tentative about it.

Why he didn't leave a phone number is a mystery, unless
this is a prank phone call by some kid having a little
springtime "fun."

Just in case a legitimate call comes in Paul, you
might want to change your voicemail greeting temporarily
to some announcement that urges callers with balloon
information to immediately leave their phone number.

I suspect the voice mail is incomplete. The recorder may have stopped before he was done. I've had cell phone calls that get dropped as they are being made.

Was there any indication that this was some farmers John Deere
tractor or a 18 wheeler tractor? I find it hard to believe that some
farmers tractor going 2 mph couldn't see a fluorescent chute and 30
some feet of string! I'm hoping for the best never the less.

From: Tony Barrett
Topic: 2548 Message: 2548
Attachments: 2 described; binary payloads are missing from this source WARC

Hello Kurt,

Didn't know if you'd seen the message below or not. Unless it was a prank call, some farmer has recovered our payloads and is trying to return what's left. It might not make sense to search by air now. I'd get some consensus from the group by e-mail before going up unless you are planning on flying anyway.

I'll be at the Science Olympiad in the NNU gym in Nampa most of the day, but you should be able to get me on my cell phone: 863-2740.

Thanks!

Tony

2549. FRS Radios

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-07 07:43:25 UTC
From: kd7pit
Topic: 2549 Message: 2549

Hey Paul,

I have my girlfriends FRS radios ready to go for Sunday. Mine are kinda messed up from last summer camping trips. Too many times in the creek I guess. I'll get some new one's. She will let me use her's for inspecting and checking the insides out. I looked into one of them and it's a small circuit board but I believe it could be altered if done carefully. I remember you asking me Saturday about FRS/GPS combos and Garmin produces one as well as Audiovox. I included the links so anyone could take a peek at them. Both are going to be spendy, especially if they are going to be altered. Walmart's website has the Audiovox's for $219.78/pair. The Garmin's won't be out until June 2002 but probably won't be any cheaper.

I know these links are long. Just cut and paste them into your browser.

For Audiovox
http://www.audiovox.com/cgi-bin/ncommerce3/ExecMacro/product_mainpage.d2w/input?prrfnbr=711407

For Garmin
http://www.garmin.com/products/rino/

Hope this helps out.

Justin KD7PIT

2550. Batteries

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-08 05:43:28 UTC
From: Stephanie Steele
Topic: 1101 Message: 2550

Hi Group,

Per our discussion at tonight's meeting, it appears that the Lithium-ion, Lithium-ion Polymer, and Lithium Polymer batteries would all be ideal for our use. They are space proven, weigh at least 1/3 less than comparable Alkaline or NIMH cells, and some are even flexible so you can fit them into available space. an example of one of the heavier types enclosed in a tin container would be a 1500 Mah Li-on that weighs 43 gm (1.5 oz). They are rated to -20C but so are alkalines for whatever that is worth. They are one type of battery currently in favor for space use along with some that would have no application for us. I have info requests out and will let you know when I know more.

Stephanie

Date: 2002-04-10 00:18:04 UTC
From: Jeff Melanson
Topic: 2554 Message: 2554

RE: GPS35- LVSHi all,

I thought I would pass this on. I already odered my GPS35-LVS from cdw.com.

----- Original Message -----
From: Wiseman, Brad
To: 'Jeff Melanson'
Sent: Tuesday, April 09, 2002 12:29 PM
Subject: RE: GPS35- LVS

Dear Jeff,

I would recommend that you consider using the GPS16 instead of the GPS35 since the GPS16 is expected to eventually replace the GPS35. It's really a better receiver at the same price as the GPS35.

Enclosed is information on pricing and ordering for our entire OEM sensor product line.

Pricing in under 100 (100 to 999) [1000 to 4999] per year quantities:

010-00124-00 GPS25-LVC $100 ($87) [$78]
010-00124-02 GPS25-LVS $105 ($90) [$80]
010-00124-03 GPS25-HVS $110 ($95) [$85]

010-10197-00 GPS25-xVx Eval Materials Kit $75 (limit 5)
325-00026-00 GPS20/25 Power/Data cable $14 ($12)
320-00031-00 GPS25 Cable assembly, RG174 with single MCX connector $14 ($12)

010-10052-05 GA27C antenna with magnetic and suction cup mounts $78.56 (1 to 4 per year) or $47.14 (5 to 99 per year)
010-10157-00 8 ft. Extension Cable for GA27 $38.09 (1 to 4 per year) or $20.95 (5 to 99 per year)
010-10121-00 MCX to BNC adapter cable $25 (1 to 4 per year) or $13.75 (5 to 99 per year)

For larger quantities of the GA27C, I would like to talk with you about bulk packaging. This would allow me to provide a much better price on the antennas. The caveat is that they must be purchased in conjunction with GPS25's. I could not offer them without also selling the GPS25's. Bulk packaging would require a 6 to 8 week lead time since we normally do not stock them in the Olathe facility in bulk.

You can download the tech specs for the GPS25 LP series products (-LVC, -LVS and -HVS) from:

http://www.garmin.com/manuals/spec25.pdf

The GPS25-xVx Eval Materials kit contains eval software, connectors, cable, a GA27 antenna with mounts and a printed copy of the GPS25 LP series tech specs.

Pricing for delivery in the US in under 100 (100 to 999) [1000 to 4999] per year quantities:

010-00153-00 GPS35-LVC $149 ($127) [$119]
010-00153-02 GPS35-LVS $149 ($130) [$122]
010-00153-03 GPS35-HVS $149 ($135) [$125]
010-00116-00 GPS35PC $159 ($145) [$135]
010-10186-00 GPS35-xVx Eval Materials Kit $50

The mounts that we sell for the GPS35 are priced for delivery in the US in singles (5 and up) per year quantities:

010-10066-00 GPS35 Trunk Lip Mount $17.65 ($9.71)
010-10067-00 GPS35 Flange Mount $20.51 ($11.28)
010-10069-00 GPS35 Suction Cup Mount $17.65 ($9.71)
010-10070-00 GPS35 Magnetic Mount $23.31 ($12.82)

You can download the tech specs for the GPS35 LP series products (-LVC, -LVS and -HVS) from:

http://www.garmin.com/manuals/spec35.pdf

The GPS35PC is essentially a GPS35-HVS that only brings out the VIN, GND, RXD1 and TXD1 lines on a 10 foot cable. The RXD1, TXD1 and GND lines are terminated at the end of that cable in a DB-9 connector that can be connected to a PC's serial port. There is an additional 8 foot cable extension from the DB-9 connector that carries the VIN and GND lines to a cigarette lighter plug, allowing the application of 6 to 40 VDC for the power supply to the unit.

The GPS35-xVx Eval Materials kit contains eval software, connectors, cable, mounts and a printed copy of the GPS35 LP series tech specs. Although the kit was designed specifically for the GPS35 LP series products, the kit may also be used with the GPS35PC or GPS36. ****Please note that the GPS receiver is a separate item and must be purchased separately from the eval materials kit.****

Pricing for delivery in the US in under 100 (100 to 999) [1000 to 4999] per year quantities:

010-00258-02 GPS16-LVS $149 ($130) [$122]
010-00258-03 GPS16-HVS $149 ($135) [$125]
010-00242-21 GPS17-N $169 ($155) [$145]
010-10302-00 Magnetic mount for GPS16 $7.10 ($4.70) [$3.60]

You can see the GPS16 on this page:

http://www.garmin.com/products/gps16/

You can see the GPS17-N on this page:

http://www.garmin.com/products/gps17n/

The tech specs for the GPS16 and GPS17 are available here:

http://www.garmin.com/manuals/spec16_17.pdf

You can download the GPS16/17 spec sheet from here:

http://www.garmin.com/specs/gps16_17spec0102.pdf

You can download the GPS17-N spec sheet from here:

http://www.garmin.com/specs/GPS17N_1101.pdf

You can download the quick start guide for the GPS16 series products (-LVS and -HVS) from:

http://www.garmin.com/manuals/GPS16.pdf

We do not currently have an evaluation materials kit for the GPS16, but I can email a copy of the configuration software if you would find that useful.

Annual quantities are determined by a combination of demonstrated sales and future non-cancelable orders over any 12 month contiguous interval of time inclusive of the date of delivery.

You can order any of the above products directly from us. Just call the following number:

913-397-8200

Ask for the "aviation order desk". They will want some form of advance payment, either credit card or cashier's check. For production quantity purchases, you may later wish to establish an OEM account with a line of credit. In that case, let me know and I can email an OEM account application and an application for credit. The credit application usually takes 2 to 3 weeks to process.

You may also order via email with our order desk:

orders@garmin.com

Please include the model designation (GPS25, GPS35, GPS16 or GPS17-N) in the subject line to ensure proper delivery.

Regards,
Brad Wiseman

Hello,

I would like some pricing information on the GPS 35-LVS please. I would also like a phone number that I can call to order this product directly from you.

Thanks,
Jeff

I recommend that a sensible approach would be to meet with the on duty Sheriff's Deputy, determine if their department has been notified of the balloon, and if not, find out from him/her who the farmers are that farm the area we anticipate is the landing area. They are likely, after the county accessor, your best source of information and can save you a lot of time knocking on doors of people who live on the farm but don't farm it. They also may have had the balloon turned over to them and/or heard some scuttlebutt about it and where it is. It will also put them on notice that you are looking for it in case they run across someone who knows about it. Leave a business card with a reliable 24 hour telephone number with everyone you talk to as a further suggestion. Just my ideas.

I've already asked a couple of times on list if you
can view the two topo maps that depict a landing
zone. Doug has now uploaded to VOI website.

Please keep in mind that if the call was not a hoax that the caller might believe that they left a complete message (no knowing the they didn't and/or the message was erased) and figure if you don't care enough to call then they are not going to worry about it. This is an extremely busy season for farmers right now and I suspect that our balloon is pretty low on their list.

Stephanie

verhap@... wrote:

> I haven't received any group emails since Sunday, was wondering if any word has been received on the balloon?
Has anyone looked for it since last week?

If I don't hear again by Friday, I'm driving out there to ask farmers
about the capsule.

> How was the meeting Sunday? Was any decision made on the April Launch - are you going to do a static flight to make sure everything works and everyone can track properly?

We'll just set up a display table for April 20th. The next launch is
the high altitude attempt in May.

> How was the turnout on the WarHawks demo Saturday morning?

Plenty of people stopped by. I don't think we picked up any new
members, however.

Telephone the sheriff's office the day of the search and ask to meet with the deputy who is covering the area you need to search. Find out where it would be convienent to meet with him and just go there! In case you get a newby that doesn't know everyone yet, be sure and ask who would be a good source of information regarding who farms what in the area. He or she will probably know who they rely on for good information.

Paul,

You might want to take along a handful of maps showing
the landing zone area to give to officials and
other interested parties. Print one and then make
photocopies for the rest.

You might make up an updated poster to post in each location the original posters were posted. I'd suggest adding "If you called us your number got cut off - please call again!" or something similar. I'd also include a large "UPDATED" or something.

These are plentiful in surplus at low cost
($1.50 to $3.00) for the small ones.

The small advantage to surplus is that you start out
knowing a little about the item such as unipolar/bipolar,
size of step, and voltage.

Yes, they are found in drives and printers. I've dug
them out of both. A web search will answer the many
questions about hooking them up and driving them.

Hank

Attachments: 2 described; binary payloads are missing from this source WARC

Thanks for the reply Hank.

Are my messages still coming through large? Is your offer to help still
open? Should I give you a call now? I think I may still have your number
in my cell phone from last week.

Do you have any recommendations about a surplus source for these
motors? Perhaps I just need to go fishing on the web. I was just passing
along a request from my friend Jim.

Best regards,

Tony

Now is not good because it's quite late here in the east.
We can get a few things organized by email off list first
anyway.

> Do you have any recommendations about a surplus source for
> these motors?

They're pretty common, so any good junk place will have a
few.

Just off the top of my head ALL Electronics and Electronic
Goldmine are two places.

Your friend will definitely want to read on the web how
to use them. It's not too simple because they have to be
driven by sequenced pulses, so you either have to have a
driver IC or a microcontroller to accomplish that.

That's what I found out on Saturday.

The restaurant said some kid found it and said he'd contact me.
The bait shop said they find radiosondes from the NWS all the
time. We'll see. The new signs explain what the capsule looks
like, so there should be no false alarms.

Happy tax day!

I spent a few minutes walking around Bruneau (that's all it takes to get around Bruneau) dropping off new fliers and asking questions. I also dropped off a flyer at the largest CJ Strike marinas. I made my last stop at the Owyhee County Sheriff's Department and left a business card. The Owyhee County Roads Department has a copy of the flyer too.

This weekend I interfaced a RAMPack B to the flight computer. On all future flights, science data will be logged into NVRAM and downloaded after recovery. I have the BS2p talking to the TNC and the TNC sending packets through the Vertex VX-150.

I'm still waiting for the GPS and HT.

I added another six pages to the book this weekend. It looks like the book's end is staying ahead of my writing. I added a new chapter and rearranged some content in an earlier chapter.

I'm getting ready to start an experiment with a beacon. I'd like to replace the old one with a new schematic (documented this time) and a PCB. I also need to document the BS1 code.

Saturday is Astronomy Day. I'll spend the day at DCI with the astroomy club. Will anyone else be there? I could use a break at noon.

Paul

It's the only restaurant in Bruneau. I don't remember the road
name.

> Did they say where it (whatever it was) was found
> (area, road, town)?

The woman at the counter didn't remember who the kid was. She
didn't say anything about where the kid found the balloon either.

2578. GPS 35

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-15 19:44:22 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2578 Message: 2578

I just got my -35 LVS in the mail. It has two serial ports (which I didn't know about). I'll ned to attach the D-submini connector to it before using.

I have some questions for Mark.
Do you use both serial ports?
Do you apply power through the DB-9 connector?

Paul

2579. Re: [tvnsp] GPS 35

> Do you use both serial ports?

No. Only the one is needed.

>
> Do you apply power through the DB-9 connector?

Yes. I believe I wired it to have V+ on pin 9. It was the same as what the Tripmates use with their adapters - since I have the low-voltage version, I can use any of the Tripmate power adapters I already have on hand.

From: verhap@occ1.sd01.k12.id.us
Topic: 2580 Message: 2580

I wired up my GPS last night and connected it to the flight computer. Nada. I mesaured the current draw by the flight computer with and without the GPS. Both times it settles down to 30 mA. The GPS should draw 130 mA. During class I'll troubleshoot the connection with some students. One of the benefits of being an electronics teacher is that my projects can be done in class as a learning activity.

But I did have two sucesses. My second RAMPack B works (I was afraid I fried it a couiple of weeks ago). I also programmed the new flight computer to take pictures.

Once the GPS problem is fixed, the flight computer will be ready for a mission. I'm planning to use non-rechargeable lithiums this time. They cost $2.50 a piece, but are rated for -40 degrees.

2583. GPS35 fixed

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-16 16:58:00 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2583 Message: 2583

In class I discovered that I had soldered the +5V line to pin 6 instead of pin 9. I had a student help me make the correction and then powered the flight computer up. I now draws 160 mA.

My plan is to program the BS2p to read GPS sentences and then store selected parts in the RAMPack.

As far as configuration, I'll send GPS data to the KPC3+ and the BS2p at the same time. The TNC will send GGA and RMC sentences every minute like Jeff's capsule. Science data will be stored onboard the capsule. I also plan to connect the BS2p to the second port of the TNC. The BS2p will send occasional status data to the TNC.

Paul

2584. GPS Data

Paul,

Ditto what Stephanie wrote. Bring everything to the Sunday
meeting and let's see what you've done so far. Let's plan on
some thorough testing with the group. What do we need to
bring? We will probably need more testing time than what we
can accomplish during the meeting.
I am still waiting for my GPS35 to arrive. I received my new
Alinco DJ-S11. I need the coax you have to replace the
folding antenna. This is the radio that I plan to use with a
CW Beacon. I will breadboard the beacon before the next
meeting. We can write code for it during the meeting.
I received my Ramsey direction finder kit today. I will
start assembling it. I talked to Stephanie about fox hunting
and she suggested that our group do the fox hunting to get
some practice in. This makes sense to me. Also we should use
the actual beacon that we would have on the capsule. This
would test the beacon and test us also. We'll find out what
we don't know!

Last night I collected data from the GPS and stored it in the
RAMPack. I also made a cable for connecting the GPS to the
TNC and flight computer. Tonight I'll test it. If sucessful, I'll pot the
connectors and bolt them into a hood. My plan is to have the TNC
send GPS data every minute. Flight computer data will be stored
onboard.

I noticed the GPS didn't get a fix inside my apartment. I believe
that's for a combination of two reasons. First the GPS has no idea
where its at, since it's moved about 1000 miles from where it was
last turned on. And second that the Navstar signals are so weak
cming through the ceiling. If it's dry outside, I'll leave the flight
computer outside for 15 minutes.

As for Sunday's meeting, we'll need a laptop to program my TNC in
case I run into trouble there. Also bring APRS.

Paul

2588. TNC and Astronomy Day and ATVQ

2591. Project: Traveler website updated for 2002b

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-19 02:10:39 UTC
From: Zack Clobes
Topic: 2591 Message: 2591

The website is now updated with all of the new flight data for our 2 May (2002b) launch. This launch will be held on Thursday (2 May 2002) at Wiley Elementary school for a group of 50 sixth graders. The students will be involved with tracking the balloon, watching telemetry data, watching ATV footage, and plotting lat/lon coordinate on a poster sized map of Kansas (hopefully we won't need any other states :-/)

www.rckara.org/project_traveler/

BTW, we still could use some additional help tracking ESPECIALLY IF IT GETS DELAYED INTO THE FOLLOWING WEEK! If any ATVers are interested, we'd loved to have an experienced op running the antenna and downconverter at the school.

Thanks,
Zack Clobes, W0ZC
Project: Traveler

2592. Canon Elph APS camera exposing roll of film while sitting on the ground

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-19 02:03:51 UTC
From: Zack Clobes
Topic: 2592 Message: 2592

I have done some more testing with our Elph film camera and the only way I can get the camera to prematurely snap the shutter is to introduce relatively strong RF fields onto the cable. I could take a 2m HT transmitting at 5W and as soon as the antenna was brought close to the cable, the shutter would snap. I believe I have helped the situation by reducing the cable length to bare minimum and adding some RF chokes/filter capacitors, but the problem does still exist to a lesser extent under the correct circumstances.

I feel fairly safe in flying this configuration on 2002b provided we do some extensive testing with cable routing while the transmitters are running. Testing was done before the 2002a flight, however this behavior was not noted on the ground. I am assuming that we just happened to have placed the controller board/cabling in just the right position for the flight on which the film was exposed.

2594. NSTAR 02-C preliminary announcement

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-20 22:32:08 UTC
From: Mark Conner
Topic: 2594 Message: 2594

Nebraska Stratospheric Amateur Radio Flight 02-C is scheduled for Saturday, May 18th, 2002, at 0800 CDT (1300 UTC). Launch site is KC0MTH Scott Clark's farm northeast of Treynor, IA.

Primary APRS beacon will be on 144.39 MHz with callsign N9XTN-11. Output power is about 800 mW (same as 02-A and 02-B). A new payload developed by Ralph Wallio, W0RPK will be tested this flight. It's a crossband repeater using Alinco DJ-S11 and DJ-S41 HTs with an uplink frequency of 446.300 MHz and a downlink of 144.340 MHz. On the VHF downlink will be the backup APRS beacon using a GPS and MIM (callsign TBD). Output power will be about 300 mW. This repeater will be full duplex which should be easier to operate.

Ralph will be advertising this flight on various lists so we can hopefully set up a long-distance QSO when the balloon is near maximum altitude. The current record is 526 miles, while the theoretical maximum for a 90,000 ft flight is 738 miles. When the balloon is above 70,000 ft, we'll ask that traffic be limited to stations on the fringe of the reception area so we can maximize the opportunity for distance contacts. We'll be using a 1200g balloon, which should get us between 92,000 and 98,000 ft.

Other payloads may include a Canon Elph APS camera and/or a camcorder. This will depend on time I get to modify the Elph and the total weight.

After last nights meeting, Jeff and I hacked a Garmin Etrex, wiring up the power switch for an external connection. The hack forces the Etrex to power back up should the batteries fail due to cold, but then revive. There's a 1k resistor in series with the power switch, by the way. Also, the Etrex draws 130 mA of current.

I got up 10 minutes early this morning and experimented with correplast. Hot glue appears to do a good job glueing styrofoam to cooreplast if you roughen up the correplast first with sandpaper.

Yesterday's test of the flight computer worked well. This week I'll get the capsule together and ready for a May 4th test. In this test, we'll load lithium AAs intot he capsule and run it up to Bogus Basin for a few hours. I hope to have Jeff's capsule ready for the test also. After the test, we'll put the flight computer into a freezer for 30 minutes.

Can we bve ready for a May 18th launch? This one will use a 1200 gram balloon that TVNSP already has. After I get back from Kansas, I'd like to attempt the high altitude launch.

We need a parachute!!!!
Mike, how is your's coming?

Does someone want to order one?

Paul

2600. Etrex modification

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-22 23:34:42 UTC
From: Jeff Melanson
Topic: 2600 Message: 2600

Paul and I modified the Etrex by bringing the power switch wires out externally. The etrex uses a momentary pushbutton to turn power on and off. We discovered that if you leave the wires connected and remove the batteries then reinstall the batteries the unit would power back up. The next step was to use a variable power supply in place of the batteries. With this I slowly reduced the voltage which simulated battery discharge and then slowly brought the power back up to make sure it would turn on again. This procedure simulates batteries that become to cold to deliver current then later warm up. The Etrex shutdown at 1.8 volts. It did NOT restart when the power was increased back up to 3.0 volts from 1.8 volts. Leaving the power switch closed doesn't work unless power is completely removed as we did when we removed the batteries which of course took the voltage to 0 volts.
Paul and I talked about using a watchdog timer. It can monitor the data output of the Etrex. If the data isn't there then it can momentarily close the power switch and it will restart (provided the batteries can deliver the current). The BASIC stamp can also look for the data and restart the Etrex if it is shutdown. The BASIC stamp can also send a message to the chase crew to let them know it happened. I personally like the idea of a stand alone watchdog timer. That way if the flight computer fails the watchdog timer will still restart the Etrex so that it can continue to send data to the TNC. We can track the capsule even if the flight computer isn't working.

From: Jeff Melanson
Topic: 2601 Message: 2601

Want a simple flight computer board already assembled for
$40.00?

Go here...

http://lynxmotion.com/

Click on Electronics (on the left)

Select "Next Step kit" (The second picture)

It doesn't have all the features that Paul's flight computer
has but it will work for many control applications. You can
always add to it. The main differences are that it doesn't
have the MAX186 Analog to Digital converter or the ULN2803
for controlling high current applications. It also doesn't
have the LM335 onboard temperature sensor. You can add any
of these if you desire. If your just going to send up a
camera controlled by servos than it's everything you need.

Subject: EOSS #56 Flight

Great Flight. I had a great time, hope everyone else did. I
used
Nick Hank's grid program in the field for the first time, and
once
operator error was corrected it worked great. We now have a good
tool
to use to accurately predict our grid locations for bearings. We
also
have a means to notify the Air Force when we are flying and our
predicted touch down point. As the trackers know, we landed
withing a
100 years of a missile silo. The Air Force security patrols were
a
little nervous about our presence. Larry Noble had used his job
resources to issue a preflight notice of our flight. The Air
Force
didn't accurately provide the data to the security patrols, so
they
were watching us while we recovered our payloads. Larry and I
then
went over to the patrol vehilce and had a great conversation with
the
two airman, and thier m-16's. We were then placed in touch with
their
headquarters, and told them who and what we were. We now have a
means
of contacting them when we fly in their territory. Believe me,
they
have the right to do what they think necessary to protect the
silos.
This brings upa good point, all the trackers need good ID on

them, and
a business card from the EOSS would be a good idea. Also, a
brochure
would have been nice to hand the airman. So, I will work on
getting
those out to the trackers in the future. Thanks to Larry Noble,
N0NDM
for driving for me, and we did have a good time. We have to do
something about Kris Krengle tho. KB0YRZ. Since he is sleeping
better these days, he has become a very, very onery person to
deal
with, also very funny. Benjie. W0CBH.

That's the right command. I have it in my BS2p's TNC initialization routine just in case I forget to set it manually. If I remember right, it will spit back the CTEXT before disconnecting, so you can "explain" that connections aren't allowed and hopefully the person won't try it again.

Mark has the right of it. Setting CMSG to DISC will give anyone attempting
to connect to the TNC whatever message is in CTEXT and then disconnect them.

One good tool to have in the field, if you routinely take your laptop, is
the PDF format of the TNC manual. I have the one for the KPC-3+, available
if I recall from the Kantronics web site. It's much easier searching that
for a particular item than searching the hardcover version.

Bill B.

Topic: 2610 Message: 2613

CMSG set to DISC is the correct parameter to prevent connects. The value set in CTEXT will be sent to the connecting station and then they will be disconnected. Be sure to also set "MYALIAS %" to prevent digipeating through the balloon. I also suggest that you set MYR to your callsign + SSID (different from the MYC value) so YOU can connect to the balloon remotely. This is valuable if you need to give the tnc a remote reset command. You will also need to enter a string in RTEXT which is your password for remote access.

Stephanie

It sounds like you're using the second comm port. My current
design has the GPS connected to both the TNC and CC/PS. The
CC/PS doesn't send anything to the TNC, it just stores data on a
RAMPack B. I like using the RAMPack since I don't have to clean
up flight logs just to get my data. And let's face it, it's my data
that's important.
;)

I will have the battery voltage and CC/PS temperature sent as
telemetry every two minutes from the KPC3+.

I'm slotting my beacons so that my packets won't step on other
capsules this July. After the May launch I want to experiment with
setting up the second comm port and a third LT buffer for BS2p
messages.

Paul

> That's the right command. I have it in my BS2p's TNC initialization routine just in case
I forget to set it manually. If I remember right, it will spit back the CTEXT before
disconnecting, so you can "explain" that connections aren't allowed and hope
fully the person won't try it again.

From: Mark Conner
Topic: 2610 Message: 2617

I'm using a KPC-3 v6.0 (non-Plus). The BS2p sits between the GPS and the TNC and parses/formats everything.

The way I time slot is by monitoring the time as reported by the GPS. As a GPS sentence is read in, the seconds portion of the time hack is parsed and compared to the previous time. If the current number of seconds is >= (15 or 45) and the previous number was < (15 or 45) then an APRS posit is formatted and sent to the BS2p. The "15" and "45" are arbitrary and can be modified.

Similarly, a telemetry packet is generated about :10 after each minute.

On the KPC-3+ v8.3, the RAM can be set up to store what was sent to the LT buffers. So you may be able to split logging duties between the Rampack and the KPC-3+.

>
> LTP 1 GPSPO VIA WIDE3-3
>
>
> My question, what is GPSPO? I understand that it's a
> destination, but what kind of destination?

GPSPO tells APRS software to use the balloon icon for this
callsign/SSID.

> The second command is:
>
> GPSPORT 4800 NORMAL
>
>
> The INTFACE GPS puts the TNC into GPS mode. The 4800
> and NORMAL make sense to me, as they are the NMEA
> standards. But why GPSPORT?

INTFACE GPS puts the main serial port into GPS mode (for non-Plus KPC-
3s that are v6 or later). Not sure of the effect, if any, on the Plus
versions. GPSPORT controls the second serial port. If you add the
keyword "CHECKSUM" the checksum data will be used to verify the data.
Also, it may be a good idea to include

GPSTIME VALID RMC

to set the internal clock to the GPS time.

That's what I'm thinking. If I use the second comm port, I can have
the TNC store all the data from the flight. I wouldn't need a
RAMPack at all.

Paul

2621. TNC Directions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-24 22:01:56 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2621 Message: 2621

Here's part of chapter 2, discussing the KPC 3+. The only other command I want to add is the LTRACK. However, I need to experiment with it before documenting it. I plan for a test of the LTRACK command next Saturday, when we run out test up to Bogus Basin.

Please look it over and let me know if there's more you'd recommend me adding.

Paul

Now the details about the following commands
.
ABAUD 4800
This sets the default communications baud rate for the KPC 3+ to 4800 baud. Set your terminal program to this baud rate before trying to communicate with the KPC.

CD SOFTWARE
The carrier detect is handled by firmware inside the TNC, rather than by the audio signal coming from the HT. Carrier Detect is the detection of someone else using the same frequency. Carrier Detect prevents your transmissions from stepping on someone else□s transmissions.

CTEXT □your disconnect message here□
The specified message is sent to packet stations trying to connect.

CMSG DISC
The CTEXT message is sent to packet stations trying to connect to the TNC before they are disconnected.

DIGI OFF
Prevents packet stations from digipeating through the main telemetry system. If you want to allow digipeating during a mission, then use a second TNC on a separate frequency

HEA OFF
Places the header and packet message on the same line. The header consists of the destination information and a time stamp. Text from the N/C takes less space this way.

UNPROTO APRS VIA WIDE3-3
Packets sent from the N/C are not sent to a specific address, they are sent to everyone on the ether. There is no acknowledgment and therefore packets are not resent if

someone doesn□t receive a proper packet. All packets are sent to an address of APRS and are repeated a total of three times (max) by digipeaters.

MYALIAS NONE
Allows a station to digipeat through the KPC3+ if they use the callsign defined in the myalias command. Since we don□t want digipeating through the TNC, there is no alias defined.

BEACON E 5
Send the beacon every five minutes. Beacons are used to identify the station, in this case the N/C, transmitting the packets

BTEXT □Your N/C□s Name□
The beacon text is the name of the N/C. Other messages can be placed here, for instance, your near space program name or a message for this particular flight. A total of 128 characters can be used in the text message.

TELEMETRY 12
Send the analog and digital values of the TNC every 120 seconds (or two minutes). The values of most concern are the AN0 and AN1 values, which are the most easily accessed analog channels. The other digital and analog values are more difficult to access from outside the TNC and are not covered above. Note that telemetry has the following format:

T#nnnn,AN0,AN1,AN2,AN3,AN5,D1D2D3D4D5D5D7D8

Where:

T#nnnn is the number of the telemetry transmission and is incremented after each transmission.
Example: T#0132

AN0 to AN5 (there is no AN4) are the digitized values of the analog voltages on the KPC3+□s microcontroller
Example: 123,375,523,078,496

D1D2D3D4D5D5D7D8 are the eight digital values on the KPC□s microcontroller.
Example: 11011001

LT Buffer Commands
The following three commands are set up for each LT (location text) buffer. Each LT buffer is programmed to collect a single GPS sentence and transmit it at a specified time and to a specified station. Use the next three commands for every LT buffer (up to a maximum of four) you want to set up in the KPC. LT buffers can be for data from a GPS receiver or the flight computer, if you have enough ports available on the KPC.

GPSHEAD 1 $GPGGA
Store the $GPGGA sentence in LT buffer 1

BLT 1 E 00:00:30 START 00:00:01
Beacon the contents of LT buffer 1 every 30 seconds, starting at 1 second after the minute. The APRS map shows data from the last received GPS sentence. New data overwrites old data. Giving the beacons different start times lets you see text on the APRS map before it is over written. Do not use the clear command with BLT. With the clear command, data in the LT buffer is erased after each transmission. Without the clear command, the last known location of the N/C is transmitted. This may be useful should the GPS fail during descent.

LTP 1 GPSPO VIA WIDE3-3
Specifies that the contents of LT buffer 1 is to be sent to GPSPO with a maximum of three hops through digipeaters.

GPSPORT 4800 NORMAL
Tells the KPC 3+ that data from the GPS receiver follows the NMEA standard (4800 baud, N81)

INTFACE GPS
Sets the KPC3 into GPS mode. When the KPC is restarted it will expect to see only standard GPS sentences. The sentences defined in the LT buffers are stored and transmitted as specified. At this time the KPC does not display text on the PC. To get out of GPS mode, you must type three Control C□s.

Now the KPC 3+ has been programmed. You will install the programmed KPC 3+ into a near space capsule at a later time.

2624. Re: [tvnsp] TNC Directions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-25 13:18:50 UTC
From: Mark Conner
Topic: 2621 Message: 2624

Setting BTEXT with a callsign is not necessary as long as MYCALL
is set to your own callsign (with or without SSID). If MYCALL is
set that way, every packet sent will have the proper ID.

While not strictly necessary in this case, setting

UNPROTO GPSPO VIA WIDE3-3

will ensure all other packets are indicated with a balloon icon.

INTFACE GPS is not necessary on a KPC-3+, and may prevent data
from being taken in on the main serial port. To access all
commands, set INTFACE TERMINAL at the beginning of the
programming. The default is INTFACE NEWUSER which prevents
access to some commands.

Setting GPSTIME VALID RMC will syncronize the TNC clock to GPS
time for proper time slotting.

Here's the code I wrote for the Basic Stamp Beacon.

```
ditdah var byte
character var byte
loop:
pause 60000
high 0
pause 500
for character = 0 to 23
lookup

Attachments: 2 described; binary payloads are missing from this source WARC

Tim,

Station ID is only required every 10 minutes during transmission. So, using MYCALL set to the correct call should take care of this, since it then becomes part of every transmitted packet. BEACON is more useful for letting people know your station is available as a digi or pbbs or whatever, like once every hour.

Bill B.

Paul,
One thing I do not see mentioned here that is very important is the station identification as mandated by the FCC. I would recommend changing the BTEXT to include a call sign and BEACON every 9 minutes or so.

Tim.....

Subject: [tvnsp] TNC Directions

Here's part of chapter 2, discussing the KPC 3+. The only other command I want to add is the LTRACK. However, I need to experiment with it before documenting it. I plan for a test of the LTRACK command next Saturday, when we run out test up to Bogus Basin.

Please look it over and let me know if there's more you'd recommend me adding.

Paul

Now the details about the following commands
.
ABAUD 4800
This sets the default communications baud rate for the KPC 3+ to 4800 baud. Set your terminal program to this baud rate before trying to communicate with the KPC.

CD SOFTWARE
The carrier detect is handled by firmware inside the TNC, rather than by the audio signal coming from the HT. Carrier Detect is the detection of someone else using the same frequency. Carrier Detect prevents your transmissions from stepping on someone else's transmissions.

CTEXT "your disconnect message here"
The specified message is sent to packet stations trying to connect.

CMSG DISC
The CTEXT message is sent to packet stations trying to connect to the TNC before they are disconnected.

DIGI OFF
Prevents packet stations from digipeating through the main telemetry system. If you want to allow digipeating during a mission, then use a second TNC on a separate frequency

HEA OFF
Places the header and packet message on the same line. The header consists of the destination information and a time stamp. Text from the N/C takes less space this way.

UNPROTO APRS VIA WIDE3-3
Packets sent from the N/C are not sent to a specific address, they are sent to everyone on the ether. There is no acknowledgment and therefore packets are not resent if someone doesn't receive a proper packet. All packets are sent to an address of APRS and are repeated a total of three times (max) by digipeaters.

MYALIAS NONE
Allows a station to digipeat through the KPC3+ if they use the callsign defined in the myalias command. Since we don't want digipeating through the TNC, there is no alias defined.

BEACON E 5
Send the beacon every five minutes. Beacons are used to identify the station, in this case the N/C, transmitting the packets

BTEXT "Your N/C's Name"
The beacon text is the name of the N/C. Other messages can be placed here, for instance, your near space program name or a message for this particular flight. A total of 128 characters can be used in the text message.

TELEMETRY 12
Send the analog and digital values of the TNC every 120 seconds (or two minutes). The values of most concern are the AN0 and AN1 values, which are the most easily accessed analog channels. The other digital and analog values are more

difficult to access from outside the TNC and are not covered above. Note that telemetry has the following format:

T#nnnn,AN0,AN1,AN2,AN3,AN5,D1D2D3D4D5D5D7D8

Where:

T#nnnn is the number of the telemetry transmission and is incremented after each transmission.
Example: T#0132

AN0 to AN5 (there is no AN4) are the digitized values of the analog voltages on the KPC3+'s microcontroller
Example: 123,375,523,078,496

D1D2D3D4D5D5D7D8 are the eight digital values on the KPC's microcontroller.
Example: 11011001

LT Buffer Commands
The following three commands are set up for each LT (location text) buffer. Each LT buffer is programmed to collect a single GPS sentence and transmit it at a specified time and to a specified station. Use the next three commands for every LT buffer (up to a maximum of four) you want to set up in the KPC. LT buffers can be for data from a GPS receiver or the flight computer, if you have enough ports available on the KPC.

GPSHEAD 1 $GPGGA
Store the $GPGGA sentence in LT buffer 1

BLT 1 E 00:00:30 START 00:00:01
Beacon the contents of LT buffer 1 every 30 seconds, starting at 1 second after the minute. The APRS map shows data from the last received GPS sentence. New data overwrites old data. Giving the beacons different start times lets you see text on the APRS map before it is over written. Do not use the clear command with BLT. With the clear command, data in the LT buffer is erased after each transmission. Without the clear command, the last known location of the N/C is transmitted. This may be useful should the GPS fail during descent.

LTP 1 GPSPO VIA WIDE3-3
Specifies that the contents of LT buffer 1 is to be sent to GPSPO with a maximum of three hops through digipeaters.

GPSPORT 4800 NORMAL
Tells the KPC 3+ that data from the GPS receiver follows the NMEA standard (4800 baud, N81)

INTFACE GPS
Sets the KPC3 into GPS mode. When the KPC is restarted it will expect to see only standard GPS sentences. The sentences

defined in the LT buffers are stored and transmitted as specified.
At this time the KPC does not display text on the PC. To get
out of GPS mode, you must type three Control C's.

Now the KPC 3+ has been programmed. You will install the
programmed KPC 3+ into a near space capsule at a later time.

2629. Project: Traveler to fly this Thursday

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-29 03:20:41 UTC
From: Zack Clobes
Topic: 2629 Message: 2629

Project: Traveler 2002b is still scheduled to fly this Thursday morning (2 May) at about 9:00-9:30am (central) from Wiley school in Hutchinson, KS. Actual lift-off time is highly subject to surface level winds since we've got a lot of trees around the school.

Flight predictions have been putting it in close to Emporia, KS, but today's prediction was about 20 miles closer than previous. I think we can keep up with it at 70 miles, but beyond that will get tough. I'm anticipating letting one of the chase teams get a 30 minute head start to try to get a little closer to it.

The payload will include APRS on 144.39MHz and ATV on 434MHz. The ATV will be turned on and off depending on altitude - a flight schedule can be found on the club website, www.rckara.org/project_traveler/. The total payload weight will be just under 6 pounds with 244 cu feet of helium in a 1200 gram balloon. Estimated burst will be at 93,000'.

If anyone has the capability of receiving the ATV, please try to record any video received as we will be compiling a video of the balloon launch for the sixth grade students.

Thanks,
Zack Clobes, W0ZC
Project: Traveler

2630. TNC Test

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-29 14:49:58 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2630 Message: 2630

I ran a test of the KPC using two comm ports. The idea is to use
one LT buffer to send data from the flight computer (data can be
PUTted into the scratch pad and then dumped into an LT buffer). I
programmed one buffer to accept $GPBS2 sentences. Initially
there were no updated to the TNC. I discovered that if you leave
the INTFACE in GPS, then the GPSPORT command doesn't work.
So I changed the INTFACE to TERM and that worked.
Unfortuantely I wasn't getting packets on my PC. It looks like the
batteries in the HT were dying. So that HT is being rechaged today
and the entire set up will be tested again tonight.

Jeff, if I run into problems again with receiving packets, can I stop
by and run the test with you tracker?

Can anyone think of a potential problem with leaving the INTFACE
to TERM and connecting the BS2p to the TNC?

To use solar power and to make it as easy as possible, I've always assumed you could connect a battery and load in parallel to the PV array. As long as the PV array outputted at least a volt more than the batteries, it would trickle-charge the battery.

Does the battery limit the voltage seen by the load? If the PV array outputs 12 volts but the battery is a 9V battery, does the load see only 9V?

To keep the battery from discharging into the PV array at night, there must be a diode in the circuit. This leads to a 0.7 volt drop. So technically, the PV array must output 1.7 volts or more than the battery.

Am I missing anything here?

Paul

2634. Re: [tvnsp] Solar Power

Paul

We use a similar setup on our equipment, where an array of solar strings will feed a battery and the load at the same time.

For a 4 cell string, open circuit panel voltage can actually be around 7.5 to 9 volts, but this is okay since it is the current that is doing the actual work, and the voltage will be lower under load. I have some panels here, and counted 16 solar cells in a string for our 4 cell NiCd battery pack. A guy who knows more about it than I do (not hard) put this one together.

The diode is up to the designer. However, you are correct in that the solar panel will act as a load if it is not illuminated, so usually is a good idea. A simple 1N400x does the trick.

After the diode, the voltage will equal that of the battery pack. The solar panel voltage under load should equal that of the battery, plus the diode drop. Again, it is a current source, not a voltage source.

Anyway, you are on the right track with your thinking. Have fun, and holler if I can help

Not necessarily trickle charging; it could be pretty heavy
charging without something to regulate. That's the main
function of these solar regulator modules.

> Does the battery limit the voltage seen by the load? If the
> PV array outputs 12 volts but the battery is a 9V battery,
> does the load see only 9V?

Well, it depends on the internal resistances of the array
and battery, but in most realistic situations, yes, the
battery wins and the voltage is "clamped" by the battery.

There is more detail to this, but it can all be done with
simple DC circuit analysis.

> To keep the battery from discharging into the PV array at night,

>
> Am I missing anything here?

Just that the use of a Schottky diode will cut that .7 down
to below .3 vlots. It could be as low as .1 volt. No reason
not to use one because they aren't too expensive nowadays.

Hank

In a relative, quite imprecise sense it's a current
source, but *not* really. What it *is* in most instances is
a higher internal resistance than the battery into which it
drains.

Because the solar panel is not really a current source, the
battery voltage depends somewhat on the solar panel
(unloaded) voltage. Just *how* much depends on the relative
internal resistances of the battery and solar panel.

2638. GPSL 2002 list?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-30 03:47:39 UTC
From: Mark Conner
Topic: 2638 Message: 2638

I'm thinking of starting an e-mail list on Yahoo for this year's GPSL. We need to start some discussions on frequencies and payloads, and the participants are scattered across at least four e-mail lists. Comments? I think the best way to proceed is to discuss this on a dedicated list, then each payload owner would report back to their "home" list periodically.

My thought is to have all payloads with either a primary or backup APRS beacon on the same frequency, preferably time slotted and probably on 144.34 MHz. If we have most everybody time slotted, we should be able to have a common frequency for the chase and the teams can mutually support each other (if one team's chase setup fails, others will still have a track of that payload). I think that if we have six in the air at once, we should be able to run four on time slots and the other two free-running without much of a problem.

I would like to fly a camcorder for GPSL and hopefully get video of the other balloons in flight. I think we have a lot of ATV activity planned as well. We should make sure we have frequencies deconflicted well before arrival - I don't think we want to argue over who is to QSY after the balloons are filled. :)

Two things to remember:
1. Voltage over the max charge voltage will damage the chemistry of the battery.
2. At altitude the efficiency of the solar cell is dramatically increased.

I like the idea. I need to get a list of attendees and who needs helium. The library is set as is the launch site. The week before the symposium, I'll reserve space at the Sirloin Stockade.

We need to have ANSR and Bill Brown on the list.

> My thought is to have all payloads with either a primary or
> backup APRS beacon on the same frequency, preferably time slotted

I'll be time slotted this time and will adjust my times to deconflict with others.

The Manhattan Radio Club knows about the launch and that we will use their repeater for voice comm. I suppose we ought to select 146.52 for simplex for times when we're out of range.

> I would like to fly a camcorder for GPSL and hopefully get video
> of the other balloons in flight.

I'll at least carry a APS camera. I may also fly a camcorder to record the effects of low pressure on objects.

Paul

2641. Cutdowns and TNC

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-30 14:36:51 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2641 Message: 2641

I have two cutdown boards and nichrome to send to Mark and Don.
I'll make photocopies of instructions today.

I noticed that when the BS2 sends text to the TNC, it's mistaken
for a command (and fails). The TNC is in terminal mode when I do
this. If I set it to transparent, I don't think the GPSport will work.

So how about this.....
I send text to the TNC like this,
LT 3 my message here ,cr,lf

This should load my message into LT buffer 3. BLT is set for 1
minute.

I'll test that tonight, but if anyone has tried this, could you let me
know?

Perhaps there's a better way. I need to send mesages to the TNC
through the PC port. The messages are part of LT buffer 3. The
first two LT buffers are reserved for GPS sentences that come
through the gpsport.

Paul

2642. Re: [tvnsp] Cutdowns and TNC

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-04-30 15:51:25 UTC
From: Mark Conner
Topic: 2641 Message: 2642

The best way to send data via the PC port (regular serial port, the DB-25 connector) is to go into converse mode.

For my initialization routine, the TNC and BS2 are powered up at the same time by the same switch. The BS2 waits a few seconds to make sure the TNC is up, then it sends 3 CTRL-C's to put the TNC in command mode (in case it's not already), then a set of commands to set things like callsign, TXD, UNPROTO path, and so forth. The last command is a "K" followed by a <CR> to put the TNC in converse mode.

In converse mode, anything sent to the DB25 port is sent out on the air, prepended with the callsign and UNPROTO path info.

If power is temporarily lost to the TNC, it will come back in command mode. If you periodically send a K followed by a <CR> to the TNC, it will put it back in converse mode. If it's already in converse mode, then the K is sent out on the air (a small price to pay). I should check to see if I'm doing this in my code - I don't think so.

I don't think you can load the LT buffers from the PC port.

- Mark

From: verhap@occ1.sd01.k12.id.us
Topic: 1536 Message: 2643

I've been told the humidity sensors will be sent today from India. I'll have to pay by wiring the money through my bank. I've never done this before, sdo its going to be an experience. But as I understand, I don't have to pay an additional fee for my check to be cashed in India.

As soon as I receive the sensors, I'll need everyone who wanted one to send me a check.

I've ordered 20 sensors at $6 a piece. I'll send them in a padded envelope, so please send an extra dollar (does that sound fair?) for the envelope and shipping. If you order more than one sensor, I just need the single dollar, don't send an extra dollar per sensor.

Is there anyone else who is interested in buying a RH sensor? I'll need to unload them as soon as possible.

Last night I played around with the TNC and flight computer (a block one CC/PS). Once an LT buffer is set up, you can send data to it with this command,

serout TNC_TX,4800I,["LT 3 your text", cr]

When it's that LT buffer's turn, the text is transmitted.

I also found out that in CONVERS mode, the GPSPORT shuts off. But when you stay in COMMAND mode, you can load the LT buffer and still send data to the TNC through the GPSPORT.

My plan is to assemble text strings in SPRAM and then send them to the TNC. Data will also be sent to the data flight recorder. Even if the BS2p fails, the GPSPORT still sends GPS sentences.

I plan to send the following three sentences, GPGGA, GPRMC, and PGRMV. The last is Garmin's three dimensional velocity sentence. The BS2p will determine balloon burst by looking at this sentence.

Don and Mark, I dropped your cutdown boards, some nichrome wire, and directions into the mail today.

I'll bring some cutdown stuff to the next TVNSP meeting for the locals.

Paul

2646. Saturday Flight Test

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-01 14:59:58 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2646 Message: 2646

I'd like to run a flight test this Saturday morning. In the test I'd like to run the entire procedure, from loading the capsule to operating it. the main electronics will use the lithiums, but I'll use alkalines in the HT, since I know it works just fine on a mission. Can I get some help with this? I need some tracking stations operating, even home-based ones will work for this. We'll use the 24 repeater for voice comm.

After loading the capsule, we need to drive it around for a few hours. The suggestion was to leave it at Bogus Basin for some time, also. We also need to give the capsule a good shake to simulate descent. At first plan to use three alkalines internally in the HT, but later I want to test using four alkalines as an external battery. Someone with an S-meter will need to watch the repsonse. After that test, I'd like to load some of the electronics into a refrigerator for a chill down test. Tracking stations need to monitor the capsule during this time. The following week I'd like to test the new parachute like we did last October. Can I get some help with that?

So I'm looking for volunteers, please let mne know.

Paul

2647. Next Launch

When would everyone like to do the next launch? Originally I was thinking of Memorial Day weekend, since the Warhawk museum has an event planned that day. However, they may not be able to open early enough. Also, that weekend is close to the end of school. Would the weekend before work for everyone? Would everyone still prefer Memorial Day weekend?

Hi Paul,

I am already committed this Saturday so I won't be able to help on site. I run my home station 24/7 so I or anyone should be able to receive the capsule's posits anytime it is operating if it is working correctly. I currently show two RMC posits from the kd4sth-11 dated 4/30 at 20:23 & 20:25 hrs.

I again suggest letting the capsule run to failure as part of the test to determine how long you can expect it to transmit on an actual mission. Rather than refrigerate the capsule at the end of the test I would suggest taking a large ice chest with ice or dry ice and doing a cooling test while at Bogus to simulate the cooling the occurs at altitude. After an appropriately long cooling test, then do the 'shake' test, then drive it down the hill and allow it to warm during the drive down. It goes without saying that the capsule should be in 'flight ready' configuration for all tests and all components (except disposable batteries) should be identified to ensure that the same components actually fly the mission configured as tested.

Just the random ramblings of a mad woman .....

From: Mark Conner
Topic: 2645 Message: 2650

Paul,

This is great info to have. I hadn't thought about this way of loading an LT buffer.

I can see something like this working for even a version 6 TNC. Instead of being in converse mode to transmit data, you can load up LT buffers instead. With the proper parameters, the LT buffers would still transmit even if the flight computer died completely. Time sync could be handled by getting the time from the GPS and setting the TNC's time at the command mode.

I'll page through my version 6 manuals and see if this is viable.

As per Stephanie's suggestions.....

Does anyone have a large enough ice chest for a capsule and antenna? If not, I suppose we could look at not mounting the antenna to the capsule.
Is there anything to do at Bogus for two hours? (I've never been there, myself). Lunch should only take an hour.
Mike, can you help and bring the launch tower? i'd like to leave the capsule out on the tower at Bogus.
For the shake test, we'll just grab the capsule by the scruff and.....

I'll bring some TVNSP literature, as we may attract some attention up there (especially during the shake test!).

I'll also bring a camera, I'll need some pictures for my book (tentively titled, The Near Space Files).

After the Bogus trip, I'll let the capsule sit in the backyard and watch it fail (and catch fire).

2655. Project: Traveler still a go

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-01 19:57:23 UTC
From: Zack Clobes
Topic: 2655 Message: 2655

Everything is still a go for tomorrow's launch of Project: Traveler 2002b at 9:00am. After a small scare last night, all equipment seems to be fully functional and ready to go.

The winds overnight do not look favorable, but they are supposed to calm down by sunrise to under 10mph. We are semi-prepared to wait closer until 11:00am or 12:00pm to launch if the winds appear to be calming down.

Today's prediction is putting the capsule's landing spot within a half mile of the outskirts of Emporia - close to where I-35 and 50 intersect on the south-west side of town. With a top speed over 140mph, we will be lagging the capsule. Don Pfister, KA0JLF is planning on chasing the capsule down from Kansas City and will hopefully beat our teams to the recovery.

The payload will consist of APRS on 144.39 and ATV on 434MHz. The ATV is horizontally polarized coming from a Little Wheel antenna on the bottom side of the capsule. GPS information will be overlaid on the screen.

If you do happen to receive any footage from the ATV, please try to record it as we will be compiling a video for the students to take home with them which will probably include some ATV footage.

Any other information can be found at www.rckara.org/project_traveler/

Thanks,
Zack Clobes, W0ZC

Well, I'm not too crazy about the prediction, but it's been bouncing around quite a bit for the past week so I don't have a whole lot of faith in it. I'm hoping it stays this side of Emporia.... we're going to dump every bit of helium we've got into it..

From: Mark Conner
Topic: 2645 Message: 2658

I looked it up in the 6.0 manual I have here - the LT, LTP, BLT, LTRACK, and GPSHEAD commands were introduced with version 6.

I believe version 8.2 included UIFLOOD (WIDEn-N capability), and v8.3 had the second serial port.

From: Mark Conner
Topic: 2659 Message: 2659

I've created the Great Plains Super Launch list at http://groups.yahoo.com/group/GPSL/ . Right now there's not much in it, but it'll get to be more over time. I've set it up so everyone is free to read messages and download files without subscribing.

I'll leave the membership open, but I imagine the most interest will be for people who are directly involved with flying payloads for the GPSL - we need to discuss frequencies, beacon rates, who's going to fly what, and so forth. The important announcements will be made back to the "regular" lists by the payload owners.

After GPSL 2002 is over and the post-mortem is finished, I anticipate we'll leave the group on the server for 2003 and beyond but that there won't be much traffic after the first of August.

So feel free to subscribe, and forward this to other people not on these lists who are planning to attend, fly, or chase at GPSL 2002.

Will you be running the recovery beacon also? One thing I've been meaning to suggest is that the recovery beacon does not need to send a position as often as the main systems do. It would help the batteries last longer and cut down on the extra transmissions.

Also, as a heads up there is a bicycle race originating in Emmett at noon that will be using APRS to track the racers. You might want to try and conclude your tests prior to that to avoid impacting that. I believe the race is scheduled for 2.5-3 hours.

>I need some tracking stations operating, even home-based ones will work
>for this.

I'll try to have my home station on and logging data. Unfortunately, I'll be out of town during your test.

Date: 2002-05-02 11:59:13 UTC
From: Zack Clobes
Topic: 2662 Message: 2662

The weather sites don't seem to be updated yet, but our cool front came through several hours early and the current weather conditions seem to be very calm. The prediction's are still putting us into Emporia, but I'm not sure if that's accounting for the front coming through early or not.

We anticipate launching on schedule at this point. However, if possible, we may try to rush it by 30 minutes or so depending mainly on how fast the kids can get out there.

Zack Clobes, W0ZC

2663. TNC Settings

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-02 15:02:09 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2663 Message: 2663

For the test flight this weekend, the TNC is programmed to send packets from its LT buffers every 60 seconds. The LT buffers are defined as follows:

LT 1 GGA at 0 sec after the minute
LT 2 RMC at 15 sec after the minute
LT 3 RMV at 30 sec after the minute
LT 4 BS2 at 45 sec after the minute

The PGRMV is Garmin's 3d velocity sentence

Every packet is sent GPSPO via wide3-3

CMSG is set to DISC and CTEXT is set to explain why

MYREMOTE is set to KD4STH and the RTEXT has also been set.

I printed out all the TNC settings and will share them at the meeting.

Paul

2664. Project: Traveler 2002b a success

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-03 00:06:05 UTC
From: Zack Clobes
Topic: 2664 Message: 2664

I just finished doing some preliminary analysis on flight 2002b from this morning and have it posted to http://www.rckara.org/project_traveler/2002b/.

All in all, the flight was nearly text-book perfect. The cold front moved through a little early than expected and we were blessed with about 6-9 knot winds at launch time on Thursday morning. Using three lanyards, we had no problems raising the capsule well into the air before releasing (we used three since we still had two of them break). We weren't quite able to keep up with the capsule, but were very close behind. We had it back in our hands within 30 minutes of touchdown (I think it was found within about 10-15 minutes, but I was caught in traffic in downtown Emporia and was the only one with a camcorder). The landing spot was viewable from the road and was only about 1/3 mile from a small blacktop road.

We did have a couple of problems with equipment this time. First off, we have seen on the ground that the ATV can cause the GPS-35HVS unit to do some weird stuff like telling us we were doing 200knots while standing on the ground, and suddenly shifting us around by several degrees lat/lon. Using packing peanuts, we were able to separate the GPS from the ATV antenna/transmitter and had no further problems throughout the flight. This is a nearly identical setup that we've flown the last three flights, just with slightly different antennas. I'm not sure why it's suddenly becoming an issue.

Secondly, we had a couple of GPS glitches as we approached burst (about 94-100k). I'm not sure why this happened, but I know that my software is very sensitive to expecting data every 1 second, and if it's delayed by more than .5 to 1 second, it will report a GPS failure. I have been able to test and confirm this behavior with two Garmin GPS-35 units and I think it's just a feature of Garmin's. The GPS immediately regained lock and kept going.

Beyond that, I would appreciate any log files that people have collected. Also, if you have recorded ATV that you would be willing to send to me, my mailing address is:

I have about 6 cutdown boards left. I'll bring some to the next meeting. Zack, have I ever sent you one? If not, email me your address and I'll drop a PCB, nichrome, and directions in the mail.

Have I forgotten anyone else?

Mark and Don, your's are in the mail. I think the Pony Express leaves Idaho next Monday.

Paul

Memorial weekend looks okay for me right now.
No family stuff or other plans in the works.
I would even give up a fishing trip for a launch. ;(

Anybody have knowledge of what callsigns will be used? If I can get the data tonight I'll have my home station logging. (I'll be out of town.)

I'm assuming KD4STH* - any others?

My guess it this isn't a matter of making changes to the
camera, rather it is just understanding the communications
protocol and plugging into the camera with a serial or usb
connection.

At 08:02 AM 5/1/02 -0700, you wrote:
>When would everyone like to do the next launch?

Either the weekend of the 18th or the weekend of the 25th (Memorial day weekend) would work for me. (except that I'm otherwise committed on Memorial day itself.)

I'm guessing that you're thinking Saturday. Correct?

Bill

2679. Flight testing

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-05 03:00:34 UTC
From: Jeff Melanson
Topic: 2679 Message: 2679

Paul and I tested his capsule by driving it up to Bogus Basin today. It tracked well on the way up. On the way down I didn't get position data for a while but still received telemetry. The GPS may have had trouble receiving satellites in the back of my truck. After we got down the hill I was seeing position data again. Paul left it turned on and took it home to run until the lithium batteries fail. The last time I checked it was still running. You can see it at findu.com. The call sign is KD4STH-11.
Did anyone log or monitor the test run on there home APRS station? How did it look to you?

Hi Jeff,

I see a good useable track to Bogus and also a report on Hwy 16 and one near Emmett. You two were busy today! I am showing posits pretty constant until 21:59 than a single posit at 22:35 hrs (it is now 23:02). Nothing since. I am unsure what time that Cinnabar came back up today as it was down this morning when I left. This may have been part of the problem on your trip down the hill. Sorry I will miss the meeting tomorrow (work). See you in 2 weeks.

The Cinnabar digi was not down. I had it turned on before Paul started. It was on all day with the exception of 5 or 6 times when I cycled it off and then on, to stop some interference with the 147.240 voice repeater.

2689. RE: [tvnsp] TVNSP Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-05 18:37:38 UTC
From: K7JPS - John
Topic: 2680 Message: 2689

Sorry, but I won't be able to make the meeting this afternoon. I have family in town.

Please bring your capsules and other projects to the meeting tomorrow. Let's make it a productive meeting and get your stuff ready for a near space flight.

2690. Re: [tvnsp] PIC based TNC

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 02:21:32 UTC
From: Bill Herrmann
Topic: 2676 Message: 2690

At 11:39 AM 5/5/02 -0600, you wrote:
>The Tiny Trak system went intermittent about half way through the 5 hour
>event. Not sure we can blame the TNC as it appears as though maybe the
>batteries went low on the GPS. Half way through the event we saw regular
>reports from the tracker "I'm a Tiny Trak II and here's my call sign", but
>no position reports. We did see maybe two position reports during the
>last couple of hours. Maybe the GPS batteries recovered, though I'm not
>sure this GPS was on a separate power supply.

I'd say the way it was mounted was probably the main difficulty there. The GPS batteries (It was powered by internal AA batteries) were brand new. I ran exactly the same GPS with brand new batteries (though a different brand of battery) for my trip this weekend. (2.5 hours each way plus probably 1.5 hours other use in between.)

In case you hadn't guessed - it was my gear running that tracker. It was NOT an optimal installation by any means. The whole works was mounted inside a motorcycle saddlebag. They didn't want us to run any cable out so the GPS unit was right inside the plastic housing with all the RF from the transmitter. The antenna was a simple rubber duck standing sort of kind of upright inside the bag.

The whole works was probably somewhat susceptible to getting RF into it. Vibration and the like may have been a factor as well. Last, but not least... How far did the leader get out front of the pack? There's almost no way the TT could have gotten out without help from a digi.

I'll do a postmortem on it Monday after I get it back from Gary. Do you have logs of the data?

Note: The TinyTrack was set so it would only transmit if the GPS data were valid. If you were seeing data without a postion there was something seriously off. The only packet I'm aware of that does not have GPS data in it is the initial power on packet so if you saw that the TT was not getting powered consistently. If so, the GPS would have powered off. (It isn't powered by the TT, but the TT controls its power state.)

>There may be absolutely nothing wrong with the Tiny Trak, but for the
>extra $20 to $25 I think I'd go with the KISS TNC because it receives too
>and you can use it with regular packet.

Depends what you want to do. AFAIK the KISS TNC doesn't have smart beaconing.

I'm disappointed that the TT didn't work out for you guys. I've run it for hours on end with no problem, but that was with a real antenna in a more friendly environment. Let's try to compare behavior in a more realistic comparison some time Tony.

Bill

p.s. Tony - Can the PIC TNC do the tracking thing and support KISS mode at the same time or is it an either or sort of scenario?

2691. Re: [tvnsp] Flight testing

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 04:17:50 UTC
From: Stephanie Steele
Topic: 2679 Message: 2691

Hi Tony,

I've noticed the same thing. I have written to Lee to see if he knows anything. I thought it might be related to Cinnabar being turned off and on but apparantly not.

Stephanie

Tony Barrett wrote:

Hey Steph,

What's the story with HARIN? Last report was six days ago.

Tony

At 11:06 PM 5/4/02 -0600, you wrote:

Hi Jeff,

I see a good useable track to Bogus and also a report on Hwy 16 and one near Emmett. You two were busy today! I am showing posits pretty constant until 21:59 than a single posit at 22:35 hrs (it is now 23:02). Nothing since. I am unsure what time that Cinnabar came back up today as it was down this morning when I left. This may have been part of the problem on your trip down the hill. Sorry I will miss the meeting tomorrow (work). See you in 2 weeks.

Stephanie

Jeff Melanson wrote:

Paul and I tested his capsule by driving it up to Bogus
Basin today. It tracked well on the way up. On the way down
I didn't get position data for a while but still received
telemetry. The GPS may have had trouble receiving satellites
in the back of my truck. After we got down the hill I was
seeing position data again. Paul left it turned on and took
it home to run until the lithium batteries fail. The last
time I checked it was still running. You can see it at
findu.com. The call sign is KD4STH-11.
Did anyone log or monitor the test run on there home APRS
station? How did it look to you?

2692. Extracting lat/lon from packet log files

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 15:09:11 UTC
From: n1ltv
Topic: 2692 Message: 2692

I need to get the lat/lons out of a couple
of files as soon as possible.

Would appreciate your suggestions on ways to
do this automatically by program, as opposed to
hand editing.

Mark has a way, Zack must have, and Rick had
a website link at one time to something he
devised, but the link as given in TVNSP a few
months back doesn't seem to be working.

Hank

send it to me, I'll do it with Perl.
Please specify (by example) EXACTLY how
you want it to appear for the file I will provide back to you.

> send it to me, I'll do it with Perl.

David,

Thanks for your fast reply. I've written Perl before, but right now I'm exhausted from working on the NH MEGA (Balloon) Launch this weekend so I was looking for help with this, and hoping someone might have something in the can.

Please contribute your Perl program as well as its results. It's funny that something like this doesn't seem to be in circulation already. If it is I couldn't find it.

> Please specify (by example) EXACTLY how
> you want it to appear for the file I will provide

The format is the one Street Atlas requires (SA 5).

Could someone please tell David what format that
is? I've lost my SA5 installation CD that might
tell what it is, but Mark and Zack do this all the
time, so they'll know.

Hank

2696. RE: [tvnsp] Re: Extracting lat/lon from packet log files

So I don't have the program written, nor
do i have the original file.
Sorry I don't read every thing that comes comes
through. If you'd like me to do this, send me the file
please. And The exact format you'd like the output
to be in. I cant do anything without both.

Attachments: 1 described; binary payloads are missing from this source WARC

here is the Perl script as an attachment.
It works. If you give me the exact output
format you want I could give you that too,
for now I've given you the framework to build
the output any way you like.

```
#!/usr/local/bin/perl -w

my $debug = 1;
my $INFILE = "latlong.txt";
my $OUTFILE = "latlong.out";

print "This is Latlong.pl\n" if $debug;

open (TheINFILE, "cat $INFILE |") || die "Cant open INFILE $INFILE $!\n";
open (TheOUTFILE, ">$OUTFILE") || die "Cant open OUTFILE $OUTFILE $!\n";

while (<TheINFILE>)
{
chomp;

#This is where your patern matching stuff goes to take OUT the lines
#that you DONT want to see in the output

if ($_ =~ /^$/){next}; #Kill Blank lines

#Just grab the NMEA lines for now
if ($_ =~ /^\$GPGGA/)
{
my $line = $_;
#if we made it this far, then print it, it must be what we want.
print "$_\n" if $debug;
@NMEA = split(',', $line);
print "This is an example: $NMEA[2]$NMEA[3] $NMEA[4]$NMEA[5] See how
that works? \n";
# The "TheOUTFILE" thing sends the next line to the outfile we want
to create.
print (TheOUTFILE "This is an example: $NMEA[2]$NMEA[3]
$NMEA[4]$NMEA[5] See how that works? \n");

}
}
close (TheINFILE);
close (TheOUTFILE);
```

```
print ("\n\nThis file has created a file called \"latlong.out\" \nwith the
same output you just got on the screen\n\n");
print ("\n\nQuestions comments? ritz\@...\n\n\n");
```

2698. RH Sensors Are Here

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 17:20:15 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2698 Message: 2698

I have 20 RH sensors now. They're about 3/8" in diameter and cost $6 a piece. If you expressed an interest in getting some, please send your money now. Include a printed address that I can put on the package (that way the post office doesn't have to read my handwriting). Also include an extra $1 for my cost of shipping. Over the next couple of days, I'll design and shoot a RH and temperature PCB. Anyone who buys a RH sensor will get a free board and directions.

The board will work with the BS as a mini-weather station or with a near space capsule.

Paul

Caldwell, ID 83605

2699. Cutdown and GPSL

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 17:22:38 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2699 Message: 2699

Zack, I dropped your cutdown in the mail this morning.

Anyone else wanting a cutdown board?

Mark I got your check Saturday. I won't deposit it until I find out if there's going to be any proceedings. The helium cost is dependent on us getting at least six tanks.

Paul

2700. Re: [tvnsp] Re: More Cutdowns

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 14:27:26 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2668 Message: 2700

A 5v reed relay, 2N3904 transistor, and 1N4001 diode. At the top
you bolt the coil of nichrome. The board is about 1" by 2".

Paul

2701. Re: RH Sensors Are Here

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 20:17:13 UTC
From: n1ltv
Topic: 2698 Message: 2701

Paul,

Could you please post a data sheet before we send
money?

If you have something, don't send it to my regular
email if it's over 20k. A better way might be
to upload to the TVNSP files area.

I guess you've never heard anything about the
missing TVNSP capsule since you posted here last.

Hank

2702. Re: Cutdown and GPSL

Yahoo group: tvnsp (2000 — 2002)

Topic: 2699 Message: 2702

> I won't deposit it until I find out if
> there's going to be any proceedings.

Paul,

The wording on the GPSL site should be changed immediately
so as not to mislead people into thinking the proceedings
are a sure thing.

Hank

2703. Re: [tvnsp] Re: RH Sensors Are Here

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 22:18:55 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2698 Message: 2703

There's no data sheets with the sensors. As I recall, I emailed a
webpage for the data sheet. The company is called Humirel and
the sensors are their HS1101.

No word on the capsule, as of yet.

Paul

2705. RE: Provisional lat/lon file conversion format

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-06 23:19:28 UTC
From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 2705 Message: 2705

Well doing the line without the time is real easy.
here you go. I'm going to hold off on the time thing until you know better
what you need. Headed home for the night, away from email.

```
#!/usr/local/bin/perl -w

my $debug = 1;
my $INFILE = "latlong.txt";
my $OUTFILE = "latlong.out";
my $OUTFILE2 = "latlong.out2";

print "This is Latlong.pl\n" if $debug;

open (TheINFILE, "cat $INFILE |") || die "Cant open INFILE $INFILE $!\n";
open (TheOUTFILE, ">$OUTFILE") || die "Cant open OUTFILE $OUTFILE $!\n";
open (TheOUTFILE2, ">$OUTFILE2") || die "Cant open OUTFILE $OUTFILE2 $!\n";

while (<TheINFILE>)
{
chomp;

#This is where your patern matching stuff goes to take OUT the lines
#that you DONT want to see in the output

if ($_ =~ /^$/){next}; #Kill Blank lines

#Just grab the NMEA lines with numeric characters after for now
if ($_ =~ /^\$GPGGA.[0-9]/)
{
my $line = $_;
#if we made it this far, then print it, it must be what we want.
print "$_\n" if $debug;
@NMEA = split(',', $line);
print ("splitting $NMEA[2]\n") if $debug;
@LAT = split('', $NMEA[2]);
@LONG = split('', $NMEA[4]);

# The "TheOUTFILE" thing sends the next line to the outfile we want
to create.

print ( "$LAT[0]$LAT[1]
$LAT[2]$LAT[3]$LAT[4]$LAT[5]$LAT[6]$LAT[7], $LONG[0]$LONG[1]
$LONG[2]$LONG[3]$LONG[4]$LONG[5]$LONG[6]$LONG[7]$LONG[8]\n");
print (TheOUTFILE "$LAT[0]$LAT[1]
$LAT[2]$LAT[3]$LAT[4]$LAT[5]$LAT[6]$LAT[7], $LONG[0]$LONG[1]
$LONG[2]$LONG[3]$LONG[4]$LONG[5]$LONG[6]$LONG[7]$LONG[8]\n");
```

```
}
}
close (TheINFILE);
close (TheOUTFILE);
close (TheOUTFILE2);

print ("\n\nThis file has created a file called \"latlong.out\" and
\"latlong.out2\" \nwith the same output you just got on the screen\n\n");
print ("\n\nQuestions comments? ritz\@...\n\n\n");

2706. Re: [tvnsp] Extracting lat/lon from packet log files

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-07 00:22:47 UTC
From: Zack Clobes
Topic: 2692 Message: 2706

I'm using some Visual Basic code to decrypt my logs. I'm gradually cleaning the code up as I run the logs through it, but so far it isn't exactly presentable.. :-)

Subject: [tvnsp] Extracting lat/lon from packet log files

I need to get the lat/lons out of a couple
of files as soon as possible.

Would appreciate your suggestions on ways to
do this automatically by program, as opposed to
hand editing.

Mark has a way, Zack must have, and Rick had
a website link at one time to something he
devised, but the link as given in TVNSP a few
months back doesn't seem to be working.

Thanks to David, Mark, and Zack for responding
to this inquiry (and Rick from EOSS for a related
question).

Mark off list said in a hurry (because he's off on
business all week) that he uses Excel.

I'm using a combination of hand editing and Excel
to do one file, and I hope to use David's to do
the next one.

This is not something that should be done manually
at all. I guess it's of interest mostly to
balloon group leaders, but something has to be
written and posted to do this nasty chore.

Hank

From: Zack Clobes
Topic: 2692 Message: 2708

I had nothing better to do this evening so I cleaned my code up a little bit.. :-) I've posted it to http://www.rckara.org/project_traveler/software/. I'm not sure it's going to help you though, Hank, since it only decodes GPGGA and GPRMC strings. Also, you would still need to clean out any extra GPGGA or GPRMC data that happens to be in the log (from other stations).

I also posted some GPS Simulator software that I wrote last fall to help simulate a GPS going up to altitude and back. Basically, you'd plug your controller into your PC (as if the PC's serial port were the RS-232 data from the GPS) and start this thing up. It pumps out GGA and RMC strings once every second until you shut it down. It came in really handy for testing my controller board to get it to snap pictures at specific heights.

Be forewarned, both of these programs are quite rough around the edges - use them at your own risk.

The web link to the company is: http://www.humirel.com

The data sheet is located at: http://www.humirel.com/data/HS1101.pdf

Is the offer to buy a couple of these open to other balloon groups?

I'll give people until summer sometime to finish ordering sensors.
By late June, I imagine, you can get some more.

> When may I call you tonight?

I was thinking about my schedule. The best time will be Thursday.
Anytime after 5:00 should be fine. I'll be working with Jeff on his
near space stuff.

I had students run a test with the RH sensor. You can use the
RCTIME command with the sensor. Use a 10Mohm resitor though,
because the RH sensor has a capacitance of 180 picos.

Hey all,
I'm done with my near craft experiment/class project and would
like to sell

1)one GPS Tripmate by DeLorme (unmodified) $40

2)one GPS Tripmate by DeLorme (modified with the TinyTrakII built in
(fully functional just hook it to a radio and you have a
station that can be tracked) $60

3)Anyone interested in a complete NEAR craft controller? working?
Basic Stamp 2 and all peripherals working perfectly... programming
software, manual (everything) for $60. Basically this is just a
basic stamp 2 development kit....

4)the Alinco radio that is so popular with near folks (unmodified)
DJ-S11T how about $70 (brand new, no scratches mint condition)
I have the box manual receipt etc etc...

Thanks!
Dave

2721. RMC GPS

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-08 03:33:53 UTC
From: Randy Farley
Topic: 2721 Message: 2721

The following was taken from the national aprs sig.
I was wondering if any one has used or is familiar with
the gps(s) mentioned below for balloon travels. The price
is right !! and no display to worry about. Haven't had
time to investigate them myself.
I have only used Garmin units so far and trust them.

The RandMcNally GPS "mouse" (just antenna and receiver but no display,
that
is intended for use with a PC) is available for $80 or so on the RMC
website,
and is an excellent performer. You sometimes see it bundled with a
(not very
good) Street Atlas "wannbe", Streetfinder, for about $120-$130.
The RMC works great with a D700 -- just supply it with 5 VDC and
connect
it to the D700 GPS jack.

Recently someone on this list said they got a Pharos IGPS-180 (the
really
tiny unit) for $130 from an online source (normally they sell for
$180-200).

2722. Re: [tvnsp] Saturday's Test (and next launch)

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-08 04:11:13 UTC
From: Bill Herrmann
Topic: 2651 Message: 2722

Anybody have a report on how Saturday's test went? (I was out of town so missed both the test and Sunday's meeting.)

Has a next launch date been picked? Volunteer time is filling up fast. I figured out Saturday that I had no less than 4 volunteer activities I could have been at...

Bill

From: Stephanie Steele
Topic: 2698 Message: 2724

I'd like to get one from you at the next meeting if you have some left. Thanks!

Stephanie

verhap@... wrote:

I have 20 RH sensors now. They're about 3/8" in diameter and cost
$6 a piece. If you expressed an interest in getting some, please
send your money now. Include a printed address that I can put on
the package (that way the post office doesn't have to read my
handwriting). Also include an extra $1 for my cost of shipping.
Over the next couple of days, I'll design and shoot a RH and
temperature PCB. Anyone who buys a RH sensor will get a free
board and directions.

The board will work with the BS as a mini-weather station or with a
near space capsule.

I don't know how the test went. We had position reports up the
mountain and at the top. On the way down the capsule was
transmitting telemetry, but we don't show a track down the
mountain.

I have no idea if this was a glitch on the tracker we were using or
the capsule. If there were other trackers running in the area, we
could at least localize the problem.

David
I would like item #3 if it is not sold yet.
Let me know how you want to make the transaction.
BTW, have you tried this GPS simulator at: http://www.sailsoft.nl/
<http://www.sailsoft.nl/>
Maybe that is where you got the sail subject line ?

David,i live and work in Fruitland. If you are in no
hurry i can wait and pick it up at our next TVNSP meeting
at Hobby Town. Or maybe one of the members closer to you
could pick it up and hold it for me.
I don't plan on going to Boise until the next meeting.

If you need to close your books quicky, then ship it to:

Randy D. Farley
1405 NW 17th St.
Fruitland,ID 83619

Let me know the shipping cost and i will get a check
or money order to you ASAP.
reply with your address to: rdfarley@... or
rfarley@....

I think my first try at this reply did not get through so i
hope it is not a duplicate.
is not a duplicate.

2737. Saturday Test?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-09 15:06:38 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2737 Message: 2737

I'd like to run another test of the near space capsule electronics. This time I'll use alkalines. I want to find out if the capsule can be tracked for four hours wihout trackers losing track of it. This test is to look into the problem we experienced last weekend.

Can I get a committment for trackers? You don't have to go on the field trip, but I need to know people will be watching the capsule. I also need more than one person to watch.

Paul

2738. Re: [tvnsp] Saturday Test?

From: John Knapp
Topic: 2737 Message: 2738

If everything goes right I will be able to track from
home. I will know for sure tomorrow. Are we talking
about 9:00am Saturday morning? And you will be on the
24 repeater?

2740. RH PCBs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-09 18:53:45 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2740 Message: 2740

I have ten PCBs completed. Five use a 555 for the RH sensor and the other five use the RCTIME command. If you'd like a board, please tell me which one you'd like to try (I don't have enough yet for everyone to try both). If you have already sent your check for the RH sensors, email me and let me know which board you'd like.

The boards operate the RH sensor and a temperature sensor.

Paul

Paul,

I'll trigger logging on my QTH Friday night/Saturday morning. I'll also add the requisite call (I assume KD4STH-11?) to my tracking list. I'll send you the results Saturday evening (going to be up in the Owyhees during the day).

Please verify I have the right call. Wouldn't do to track some tracker over in Ohio by accident! ;-)

Paul
My station runs 24/7 so it will monitor in my absence.
Just need to remember to turn logging on. You may have
to wade through a lot of extra pre test and post test data.
I have TVRA club functions to help with this Saturday.
Good luck.

Because I could, basically. I don't know any pros and cons of either design. I suppose I'd prefer the RCTIME board, but that's because of the lower parts count.

Either design should be equally effective.

BAS holds a star party at Bogus Basin this Saturday. Everyone is invited. Drive up the road to Bogus. At the hair pin turn, about two miles from the very top, is a turn out. As I understand it, that building is a restaurant. The telescopes will be in the gravel lot at the turn.

The ISP is scheduled for September 6 - 8. We're scheduled to present for one hour on Friday night at 7 PM. The launch is scheduled for the next day at 6 AM. We'll need to set up a tracking station for the public. We should have a crowd during the filling, but since they will have been up all night, they may crash after launch. I hope to talk at least one of them into video taping the balloon through a telescope.

From: RITZENTHALER,DAVID (HP-Boise,ex1)
Topic: 1876 Message: 2750

I don't know of any restaurant two miles before Bogus...
So i checked the webpage
http://www.boiseastro.org/calendar.htm#i_Blacks%20Creek%20Exit
<http://www.boiseastro.org/calendar.htm#i_Blacks%20Creek%20Exit>

May11th they have listed as "Blacks Creek".

You might want to iron that all out before you head up there.

Blacks Creek Exit Star Party:
Drive east from Boise on I-84
Exit just past the first rest area (Exit 64)
At the stop sign, turn left and travel about one-half mile
Just past the cattle crossing sign turn right into the gravel lot.

The viewing site is about 100 meters square.
Travel time is about 20 minutes from downtown Boise.

From: Jeff Melanson
Topic: 2753 Message: 2753

http://www.cybikoextreme.com

Jeff and I are looking into purchasing ten of these units for about $11 a piece. Bill demonstrated them last night as a type of APRS terminal. They also work as simple RS232 terminals. They appear to be a cross between a game computer and PDA. They have a built-in RF port that operates over the 900 MHz ham band, but are low power (something like a 300' range). The development software is free, in case you'd like to write your own apps. The game software is free, also, in case your kid wants to play with them.

Bill can you explain to the group what you were able to do with the Cybiko?

Is anyone interested in ordering some of these?

Paul

At 07:15 PM 5/9/02 -0600, you wrote:
>http://www.cybikoextreme.com

That one didn't work for me. You can also get there by going to http://www.cybiko.com and then clicking on the US flag. After that click on Cybiko Classic in the lower left corner.

Caution: You want to make sure you get the Classic Cybiko if you want to do RS232. The Cybiko Extreme uses a USB connection.

Note: There are (at least) two models of the Classic. If possible you want to try to get the one that does NOT have the black switch on the side. You want the one that has the on/off legend above the <esc> key. You can sometimes tell by looking at the picture - if you see two darker areas to the left of the display it probably has the switch although some sellers just use a generic picture rather than one of their unit.

>Bill can you explain to the group what you were able to do
>with the Cybiko?

I was running UI Messenger a free APRS application available at http://www.qsl.net/kr1st/

I had one unit out in the car hooked up a 2M HT and an old KPC3 running in KISS mode. (Old as in version 5 firmware!) That unit was running UI Gate, which comes with the above application. It's a gateway between the radio/TNC side and the built in 900MHz transceiver.

In the back room I was able to pick up APRS transmissions on the 3 Cybiko's that I had with me for the demo. I could also have sent messages and/or positions and have had them sent out via 2M. (going through the gateway)

I also showed a small solar panel available at Harbor Freight for about $11 that has the right voltage and plug for the Cybiko.

I mentioned, but did not show, a VT100 emulator that you can download also. I'm not sure it'll send control characters, but it's at least somewhat useful and comes with the source.

As mentioned by Paul the software development kit is free. There are some applications and lots of games available for download at the Cybiko site.

>Is anyone interested in ordering some of these?

If you can find them for $11 I might pick up another one or two. If you buy them from EBay they typically go for about $30 for a new one still in the box (including shipping) or around $25 for a used, but in good shape one. I've seen them go for more than that, but if you're patient you can get

them for that.

2760. Email Virus Alert: W32.Klez.H@mm and variants

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-10 13:51:16 UTC
From: Stephanie Steele
Topic: 2760 Message: 2760

Dear Peach Tree Consulting Customers & Friends,

I wanted to make you aware of a current high risk virus that is circulating in the wild. This email virus affects computer workstations that use Microsoft Outlook or Outlook Express. Please read carefully and forward to anyone you believe could benefit from this information.

A software patch and effective virus definitions are available for this. Please let me know if you would like me to assist with the installation of the patch or need help updating your virus definitions. There are also other strategies to deal with this and other virus attacks that I would be happy to share with you. Just let me know what help you need.

As always, keep your virus definitions up to date and don't open email attachments that you are not expecting and/or are not from trusted sources. Thanks!

Stephanie Steele
Peach Tree Consulting

SEVERITY: MODERATE

PRODUCTS AFFECTED: Outlook, Outlook Express, Web-Based Mail Programs

****

WHAT IS IT?

W32.Klez.H@mm is variant of the Klez virus, and it is currently spreading in the wild. The methods of prevention and removal are similar to previous versions of this virus. The Microsoft Product Support Services Security Team is advising customers to take preventive measures, if they have not already done so, to prevent infection.

IMPACT OF ATTACK:

Mass-Mailing, Destruction of Data

TECHNICAL DETAILS:

The W32.Klez.H@mm virus arrives as an e-mail message with an executable (.exe) or (.scr) file attachment. The virus uses the vulnerability that is described in Microsoft Security Bulletin MS01-020 to attempt execution in the Preview pane. The virus is currently spreading, and exact details of the message characteristics are still being determined. The following details represent our current understanding of the virus:

Subject (can be any of the the following subjects, and this list is not exhaustive):

Undeliverable mail--"[Random word]"
a [Random word] [Random word] website
a [Random word] [Random word] patch
[Random word] removal tools
how are you
let's be friends
darling
so cool a flash,enjoy it
welcome to my hometown
the Garden of Eden
introduction on ADSL
meeting notice
questionnaire
congratulations
sos!
japanese girl VS playboy
look,my beautiful girl friend
eager to see you
spice girls' vocal concert
japanese lass' sexy pictures

Message Body (Varies):

This is a nice game
This is my first work.
Your're the first player.
I would expect you would enjoy it

Hello,This is a humour game
This game is my first work.
You're the first player.
I expect you would like it.

Attachment:

The attachment currently either ends in .exe or .scr and other file extensions can precede the .exe or .scr ending, for example:

filename.bat.exe

Once infected, the worm tries to mass-mail itself to e-mail addresses in the Windows Address Book and in local files. The worm also tries to copy itself to local drives, mapped drives, and network drives. The worm also carries a copy of the W32.Elkern virus as an additional payload.

Please contact your Antivirus Vendor for additional details on this virus.

PREVENTION:

Install the patch that is associated with Microsoft Security Bulletin MS01-020. Because Microsoft Security Bulletin MS01-020 has been

superceded, you must install the patch for Microsoft Security Bulletin MS01-027 (which includes the functionality of MS01-020). You can download the patch for MS01-027 at the following Microsoft Web site:

http://www.microsoft.com/technet/security/bulletin/ms01-027.asp

If you have already installed the patch, the following prevention details apply:

Outlook 2000 post SR1 and Outlook XP include the functionality to block harmful attachment types. If you are running either of these versions, they will (by default) block the attachment, and you will be unable to open it.

By default, Outlook 2000 pre SR1 and Outlook 98 do not include this functionality, but it can be obtained by installing the Outlook E-mail Security Update. More information about the Outlook E-mail Security Update can be found here:

http://office.microsoft.com/Downloads/2000/Out2ksec.aspx

Outlook Express 6 can be configured to block access to potentially-damaging attachments. Information about how to configure this can be found here:

http://support.microsoft.com/default.aspx?scid=kb;en-us;Q291387

Outlook Express all other versions: Previous versions of Outlook Express do not contain attachment-blocking functionality. Please exercise extreme caution when opening unsolicited e-mail messages with attachments.

Web-based e-mail programs: Use of a application-level firewall can protect you from being infected with this virus through Web-based e-mail programs.

My station runs 24/7 so it will monitor in my absence.
Just need to remember to turn logging on. You may have
to wade through a lot of extra pre test and post test data.
I have TVRA club functions to help with this Saturday.
Good luck.

The newsletter seems to imply the only star party is at
Bogus this weekend. It rated the whole right column on the
front page, so they must be serious.

There must be some confusion,
Tony (of HP) was the first to reply asking for the modified one.
Kevin (of HP) had an email in 8 minutes behind Tony's asking for both.
So Tony got the modified one, Kevin got the unmodified one....

I'm 100% sure that they were the first with respect to the GPS's.

I'm sorry if there has been some miscommunication. I delivered
the GPS's and received money the same day the original email went out.

It's only written for KISS mode at the moment. (The author has one of the
John Hansen PIC TNC's that only does KISS mode.)

It could be used as a terminal with a D7A but that's probably about it
unless you write the software for it.

Date: 2002-05-13 15:49:25 UTC
From: BLOHM,BILL (HP-Boise,ex1)
Topic: 2778 Message: 2778

Well, I was set up to log the TNC data and whatever else I could for the simulated balloon launch scheduled for 0900. I was out all morning and when I got back home around 1300, there was nothing there. No balloon in my history, position tabs, nothing. I turned off logging and forgot about it. Later on that night, I decided to see what was happening in APRS and lo, there was data from the balloon! Boy, talk about a late "launch"!

At any rate, my question is, where should I send the data I was able to cut and paste and therefore save? It's a text file, tab delimited of course. If anyone wants this data, say the word.

73 de Bill, KC7JSD

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-14 23:25:16 UTC
From: Jeff Melanson
Topic: 2784 Message: 2784

Hi TVNSP,

Paul came over last thursday and we made a lot of progress putting together the flight computer and some programming. The flight computer will do two things on the upcoming flight. It will monitor data from the Etrex GPS and if the data isn't there it will close a relay that starts the GPS. The second thing it does is send a CW beacon every two minutes. While it's not busy it goes to sleep. I'm using the BS2 (not the BS2SX or the BS2SX Plus). The BS2 draws 40 milliamps while it is busy and only 100 microamps while sleeping. It spends about 15 seconds checking the GPS and sending my call sign then sleeps for 1 minute and 45 seconds. If the flight computer fails it will not affect the tracker. This is the same philosophy that Paul has started using on his capsule. In the future I will add more features. I'll add a camera with servo control, monitor temperatures and voltages, etc. One step at a time.

I'll be bringing it in to the Sunday meeting for demonstration and testing. I'll have copies of the code for everyone to review.

2785. Last Night's Test

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-15 15:04:30 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2785 Message: 2785

Last night's tests ran longer than I thought they would. But it looks like everything is now running. After last night's debugging session, the avionics now does the following.....

Increment a counter
Check battery status (is battery voltage is getting too low?)
Is the capsule still rising (through GGA and RMV sentences)
One other status check that I've forgotten
Run experiments
Save results in the flight data recorder
Send results through TNC (in LT4)

All the data comes down every 60 seconds in a single packet. This is the part I like. The first half of scratch pad ram store GPS sesntences. The last half is used to build a data record. As results come in, they're put into scratch pad. an entire record is built up over the course of a mission cycle. At the end of the cycle, the data is GETed from scratch pad twice. The first time it goes to the flight data recorder which is running in fifo mode. The second time it goes to the TNC as LT 4. At 45 seconds after, LT 4 is sent to the HT.

After recovery of the capsule, I download the read the rampack code and then restart the capsule. A terminal program on a PC or laptop then gets all the data from the RAM Pack. I still have to figure out how to get the terminal program to store the incoming data as a file.

I'll run another test tonight before the ham meeting.

The next project is to get my new parachute ready.

Paul

Thanks.
I am trying the old terminal program in Windoze. Every time I tried
to create a file, I got an error.

Doug, do you plan to be at tonight's meeting? I'll bring the capsule
and show you the program.

Paul

2789. TV02B Flight Code

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-16 14:46:37 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2789 Message: 2789

for those interested, I'm attaching the flight code for the next launch. Experiments include a RH and temperature sensor and photometer that measures sky brightness. There will also be a camera directed to the -Z axis (straight down). There should be enough film to take pictures of the landing site.

Once the capsule is powered up, there will be 10 minutes before it goes into flight mode.

There's room for additions to the code. For instance, I plan to use a launch commit switch in the future that signals the flight computer to go into flight mode (rather than idle in a preflight mode). I'll also add a minimum altitude the capsule must reach before it can go into descent mode. This prevents the capsule from thinking its descending when it hasn't been launched within 10 minutes of start up.

The BS2p that I'm using has 16 kb of memory (in eight slots). So far the code is only using 3/4 of the available memory of one slot.

To look at the code, open the file with notepad.

Paul

2790. RH Sensors

Topic: 1821 Message: 2790

I have orders from Ralph, Lloyd, and Mark W. As I recall, you all ordered two of them. If not, please let me know.

Marrk W. I'm including the cutdown board and a flight computer board. With the cutdown there is 6" of nichrome wire. All the instructions come with the boards also.

I will proabably drop the packages off at the post office today after work.

Paul

2791. Capsule Test at Zoo Daze

I'll be manning the Astronomy Club's table at Zoo Daze this
Sunday, from 10:00 AM to noon. They gave me permission to
bring near space stuff, so I could advert there along with the club.
Look for the capsule to be transmitting this Sunday at the Zoo.

If you'd like a RH sesnor, please bring your money to the Sunday
meeting. The sensors cost $6.

Paul

Do You Yahoo!?
LAUNCH - Your Yahoo! Music Experience
http://launch.yahoo.com

2793. Status, 20 May

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-20 14:34:01 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2793 Message: 2793

I made one more change to the flight software. In case the altitude is not parsed from the GPS properly, there's a second routine to operate the camera based on mission reps. Each rep is about 60 seconds long. Nominally, photos will be taken every 750 meters. The back-up routine will take them every 5 minutes.

I'll forward a copy of the flight code and telemetry format later today.

Three switches operate the capsule, Main, HT, and TNC. The other two are not connected (Servo and Aux). The camera needs to be opened just before launch. There is a Remove-Before-Flight tag on the camera to remind us.

I'll zero out the flight data recorder tonight.

Helium! We need another tank of heliu. Doug, do we still have money in the VOI account? Can you pay for another tank of helium at Shennans? It under the Treasure Valley Near Space account.

Mike, can you pick up the tank?

Please start running predictions. My capsule weighs in at 5 pounds. Jeffs weighs in at 4 pounds. The parachute is around 1 pound (I'll get a better measurement tonight). Plan for a 1000 fpm ascent and max altitude of 90,000 feet. Descent will be around 1200 fpm.

Paul

2794. Prediction

From: John Knapp
Topic: 2793 Message: 2794

The prediction I got this morning is:

Bearing:350.2
Range: 48.5 mi
Time: 83 minutes.

The MFI shows the winds Saturday morning will be from
west, looks like they will be moving as the isobars
are close.

The launch is scheduled for Saturday morning, May 25.

John the elder.

2804. Launch Co-ordinates

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-21 05:48:56 UTC
From: Stephanie Steele
Topic: 2804 Message: 2804

I could also use our known lauch site coordinates. Thanks

Stephanie Steele wrote:

I am attempting to use balloon track for the first time. Will someone please give me all the parameter values that need to be set to get accurate predictions. I would like to calculate along with everyone else so I can learn this part of the process. Thanks!

Stephanie

verhap@... wrote:

for those interested, I'm attaching the flight code for the next launch. Experiments include a RH and temperature sensor and photometer that measures sky brightness. There will also be a camera directed to the -Z axis (straight down). There should be enough film to take pictures of the landing site.

Once the capsule is powered up, there will be 10 minutes before it goes into flight mode.

There's room for additions to the code. For instance, I plan to use a launch commit switch in the future that signals the flight computer to go into flight mode (rather than idle in a preflight mode). I'll also add a minimum altitude the capsule must reach before it can go into descent mode. This prevents the capsule from thinking its descending when it hasn't been launched within 10 minutes of start up.

The BS2p that I'm using has 16 kb of memory (in eight slots). So far the code is only using 3/4 of the available memory of one slot.

To look at the code, open the file with notepad.

Paul

2805. Tuesday's Predicitons

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-21 16:26:49 UTC
From: John Knapp
Topic: 2793 Message: 2805

Using this morning data, I got the following:

Bearing: 331 Degrees
flight Time: 114 minutes
Range: 41 miles.

The MRF looks like the winds will be from the west,
also looks like the isobars are widening so the winds
may not be too strong.

JohnK

2806. Jeff: Western Aircraft

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-21 21:44:45 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2806 Message: 2806

Sorry to distrub the list, but I didn't have Jeff's email address.

Jeff, look for me and my class at Western Aircraft tomorrow. Dan
set up Wednesday as a field trip for my three classes.

Paul

2807. Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-22 03:47:26 UTC
From: Mike Garske
Topic: 2238 Message: 2807

If I read this right, for 0000z 22 May 02, the predicitions are:

Bearing 15.6 degrees
Range: 7.4 miles (!!)
Flight duration: 116.7 minutes

Wow, anybody up for a short chase tonight?? :)

Mike KC7DPD

I did one this morning using 000Z 22 and got:
(if i did it right)
Bearing 30.6 deg.
Range 6.3 Mi.
Flight Time 123 Minutes

Could get dizzy watching it overhead or go for breakfast
and monitor from Pancake House ;)

The only problem is that the camera takes pictures of the same
place, over and over again.

;)

Pete Sias' first launch landed one mile from the launch site. They
trained a lot for DFing the payload and ended up watching it go
straight up and straight down.

Pete's the one who got me started.

I used 12Z for May 22 and got the following:

Flight time 114 minutes
Bearing: 106 degrees
Range: 12.3 Miles.

The MRF is showing upper winds from the west and looks
like they will be fairly slow - isobars are getting
further apart. Paul, am I reading the MRF correctly?

The balloon path is really strange if you look at it.
It basically doubles back on itself then does a lazy W
before landing.

I like the idea of watching it from IHOP......

I connected the ring and bearing to the top of the parachute. A few days ago I sewed the rings to the ends of the shroud lines. The parachute is complete. I'll weigh it today.

I loaded the line and battery into the flight termination unit (FTU). It's also connected to the top of the parachute. We can set the timer during Friday's dinner. If there's a significant change in launch time, we'll reset the timer at the launch site.

The MRF forecast sounding for Saturday morning shows winds from the WSW (240-250) for most of the atmosphere. Strongest winds were about 45-50 mph. I would guess from this you'll end up about 060 at 40 miles or so from the launch site.

Looks like a decent day for Saturday - some high clouds and maybe some late afternoon showers.

- Mark

I finally fixed LIFTWIN which was underestimating burst
heights for the 1000g and 1200 gram Kaymonts. It was
a quick fix so it hasn't been uploaded to HABLIC website
yet.

For the above figures LIFTWIN is saying 280 cubic feet of
helium and about 5 pounds of free lift. Burst height 87k
feet but the Kaymonts seem to typically do a little better
so 88-91k is about right for height.

Here's my 2 cents worth of info. Just downloaded balloon track (v 1.7.7)and tried it out. Here's my results

Using the 12Z 23 May 2002 data:

Range: 23.6 miles
Bearing: 222.0 deg
Duration: 80.9 min.

Boise NWS is calling Saturday as P. cloudy, highs 70-75.

This morning I got the following from the 1200Z data:

Range: 23 Mi.
Bearing: 224 Degrees
Duration: 117 Min

I did notice in the data there were no values between
53,281 and 90,000 ft, either direction. What
difference does this make on the outcome? I am using
version 1.7.4.

There is a way to obtain that gap data at higher altitudes
using the UWYOMING sounding site. Almost no one knows how
to do this, and I only found out about it myself a month ago
from UWYOMING site programmers. No one should have to fill
in the gaps, the data is almost always right there, you just
have to know how to operate UWYOMING site.

On the subject of predictions:

With the uppper air as it is over Idaho, all these predictions
based on Wed. and Thursday *actual* soundings are going
to be in error.

As Mark has said, the FORECAST winds Saturday will be from
west to east. TVNSP balloon will undoubtedly go to the
EAST. Go by the direction and bearing Mark has already
posted.

He may have a better one for you today, and I may do one
if I have time.

I'll upload a graphic of the winds over Idaho for today
and forecast for Saturday and it will be crystal clear
what's going on.

Hank

2819. good predictions need the correct winds

Attachments: 1 described; binary payloads are missing from this source WARC

Here's that graphic that shows how there's a
swirl of upper air currents centered just about
over southern Idaho. Go in any direction and the
winds have all kinds of directions, some places
have almost no wind.

With this going on, predictions done with Thursday
soundings give you practice using Balltrak, but are
of no value otherwise.

The Saturday graphic clearly shows a spatially
consistent west to east flow over the northern
Rockies and in fact the entire West.

TVNSP will go east on Saturday.

To get all the data above 100 millbars at UWYOMING,
often it's necessary to click the recalculate button
at the lower left of the screen.

If you get a sounding file that stops at 100 millibars,
go back to the selection page and click that recalculate
button and then get the file again and it will be complete!

Once anyone does this, it will be fixed forever.

If you look at today's 12Z for Boise, it will be fixed
because I did the recalculate already.

I agree 100% with you about the forcasts from today
vs. Saturday. We are practicing, making sure everyone
is in agreement with each other on the forcasts.

Thanks for the info on the missing winds. I will try
the prediction again with the changes.

Judging from the MRF, the balloon should west to east.
The winds aloft look like they are not to strong. Of
course, Saturday morning it could change in a
hurry....

The above is what Mark did Wednesday by eyeballing the
forecast data. It was pretty good on bearing and very
good on range.

By running an actual numerical prediction using forecast
winds for SATURDAY, the range is 42 miles at a bearing
of 93 degrees. Total flight time 140 minutes. This
procedure is tedious, involves a bunch of hand entries
and conversions, and is not fun.

I'll have to write a whole bunch of little programs to
do all these conversions automatically.

Incidentally, the graphic I posted is the AVN model, and
it agrees with MRF on the direction of the jetstream
Saturday (as best as one can tell by looking at a diagram).

To summarize what data was input:

1000 ft/min ascent
1200 ft/min descent
90,000 foot burst

MRF model for Saturday 12 UTC obtained Thursday afternoon

For real planning purposes to try to get the balloon down
in a nonpopulated and non-mountainous area, I've done
an actual numerical prediction for TVNSP which was just
posted.

I hope there is some thought going on even *today* about
where to launch to accomplish a nice recovery.

Certainly by tommorrow afternoon the predicted landing
spot should be pretty reliable. I'll do at least one
complete numerical prediction tomorrow to increase the
chances of a not too difficult TVNSP payload recovery.

The numbers above are my swag. When we fill the balloon outdoors and attempt to put 2 PPL in the balloon, we'll see closer to 1000 fpm. (the problem occurs because even a light breeze will throw off our measurements and we'll error on the side of caution).

I've set up reservations, but they are for 6:30.

Paul

6:30 works for me!

Haven't heard if Doug put money in our Sheenan's Helium account, has that
been done? I will pick it up around 3pm today.

2829. Re: [tvnsp] Re: good predictions need the correct winds

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-24 13:37:30 UTC
From: Stephanie Steele
Topic: 2819 Message: 2829

If the flight distance is 20-25 miles as it appears to be now, I would suggest launching from the Vale, Oregon area if the winds are from the west and from Farewell Bend if the winds are from the northwest. There is a third option if the winds split the difference. Landing would be between New Plymouth and Emmett in farmground.

Stephanie

n1ltv wrote:

> Judging from the MRF, the balloon should go west to east.
> The winds aloft look like they are not to strong. Of
> course, Saturday morning it could change in a
> hurry....

For real planning purposes to try to get the balloon down
in a nonpopulated and non-mountainous area, I've done
an actual numerical prediction for TVNSP which was just
posted.

I hope there is some thought going on even *today* about
where to launch to accomplish a nice recovery.

Certainly by tommorrow afternoon the predicted landing
spot should be pretty reliable. I'll do at least one
complete numerical prediction tomorrow to increase the
chances of a not too difficult TVNSP payload recovery.

Hank

2830. Flight CD-ROM

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-24 13:41:24 UTC
From: Mike Garske
Topic: 2830 Message: 2830

Paul and the group,

Does anyone have anything to add to the CD I am going to burn for this flight? I have pics from our last 4 or 5 launches. I was also going to put APRS, and Balloon Track on the CD. There is still plenty of room available if anyone has any ideas. If so, bring whatever it is to the dinner tonight!

Mike KC7DPD

2831. Balloon Track 1.77 Bug?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-24 14:00:30 UTC
From: Mike Garske
Topic: 2831 Message: 2831

Ok, I downloaded 1.77, and ran it last night with no problems. Tried it this morning, and when I go to open the data file, it shows a blank screen, no data comes up in the main window. All it does is turn green, and I can't run a track.....am I doing something wrong? I even tried older data files, no luck.

From: verhap@occ1.sd01.k12.id.us
Topic: 2833 Message: 2833

I thought we budgeted for two flights (two balloons and three or four tanks). Each flight costs about $150.

If there's a problem here, then the group can split the cost.

From: kd7pit
Topic: 2831 Message: 2838

Hey Mike, I noticed the same thing too. Here's what I did. At the top, click SETUP and then look to the mid-right for something called "FLIGHT TIME AS" and then switch the bullet from "TIME OF DAY" to "MINUTES AFTER LIFTOFF" and then click "SAVE TO DEFAULF CONFIG FILE" That seems to work. Hope this helps.

Justin, KD7PIT

Jeff

It is fine for me. I'm a bachelor this week, so I make all
the important domestic decisions now :)

2840. Landing prediction using forecast winds for Saturday (+36 hours)

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-24 16:20:06 UTC
From: n1ltv
Topic: 2840 Message: 2840

Again, this is a prediction based on winds expected
Saturday by a NWS computer atmospheric model.

From Thursday (MRF Thursday afternoon):

range: 42 miles
bearing: 93 degrees

For Friday (MRF +36 hours):

range: 45 miles
bearing: 82 degrees

From yesterday to today there's fairly good agreement
for bearing, and very good agreement on range.

There appears to be a mistake in Balltrack because for
a given burst altitude and the same ascent and descent
times, the flight duration should be unchanged, but it
isn't.

It's between 130 and 140 minutes at any rate.

Inputs to prediction that are always used:

1000 ft/min ascent
1200 ft/min descent
90000 foot burst
MRF wind model
Balltrack 1.7.1

Hank

2841. Using Balltrak with predicted winds

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-24 16:26:24 UTC
From: n1ltv
Topic: 2841 Message: 2841

Thanks to Mark Conner I now know it isn't necessary
to use all the hand calculator conversions I was doing
a few days ago to get these TVNSP predictions.

I've never had to do these before since our SkyQuest
payloads are throwaways and where they end up in the
ocean is just a curiosity.

Hank

2842. Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-24 16:28:05 UTC
From: John Knapp
Topic: 2825 Message: 2842

I came up with the folowing:

Flight time: 114 minutes
Bearing: 125 Degrees
Range: 39 Miles

The MRF is still showing west winds. It would be very
wise to do a prediction tonight after the meeting to
update the data. I decision on exact launch point may
not be able to be made until tomorrow morning.

My penny's worth.

I wish everyone a good chase, wish I could join in but
will be out of town. Please send out an email after
the meeting tonight on where you will be launching
from. I will be out of radio range but will track via
the 'findu' program.

JohnK

2843. Re: [tvnsp] Landing prediction using forecast winds for Saturday (+36 hours)

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-24 16:40:58 UTC
From: Mark Conner
Topic: 2840 Message: 2843

Recommend using the Eta model when you're within 48 hours of launch. The Eta has much finer grid spacing in the horizontal and vertical than the MRF and should yield more accurate results.

The MRF is only run once per day at 00Z. The Eta is updated 4x/day.

You may have to "cut and paste" wind data from a BOI sounding to get winds above 60,000 ft. What I usually do is get the latest real sounding at the same time I get the forecast data, delete the forecast wind data above 60kft, then cut and paste wind data from the real sounding to the forecast for anything above 60 kft.

From: randy farley
Topic: 2804 Message: 2844

Group

Here is a tip and time saver if you are afraid of loosing
your launch site coordinates. In the "Balloon Track" main
folder there is a "configuration settings" file called
"launchsites". Probably obvious to most advanced users.
This file can be cut,pasted or zipped up for safe keeping.
I always hate re-entering data that is lost by upgrading
or some other gremlinish act. And they say computers are so

smart or was it the operator. ;)

> There is still plenty of room available if anyone has any ideas.

A few ideas...
Which APRS? You might include a couple choices of client software along with local maps for programs that need them.

LiftWin and any other useful utilities would be good. (You already mentioned Balloon Track.)

Personally, I'd like to see at least one set of data files along with their associated prediction so that a novice at prediction (me) could run through the mechanics of doing a prediction and check the answer.

It would also be good to include a set of links for useful web sites.

Bill

Looking at the MRF, I see that currently the winds are in the greatest flux (in direction, not speed). By this afternoon it looks like the winds will settle from a direction around 270, with very little variation over the weekend. I really dislike it when the winds are dramatically changing directions from day to day. this may be very much like our flight last year that landed near Middleton.

So we'll pretty much launch straight west from where we want the capsule to land. I vote that we let it land on top of my apartment.

At tonight's meeting, we'll check out the launch equipment and capsules. Bring maps.

Who will be attending the launch? Who will be running trackers? I haven't heard from John the Younger for a while. John, will you daughter or wife let you attend?

Paul

I did a quick prediction using the 12Z and 18Z winds from the Eta model. Both showed a distance of 40 miles, but the 12Z landing was on a bearing of 095 and the 18Z landing was on a bearing of 080.

Good luck tomorrow.

I plan on attending launch with tracker and DF antenna
ready to go chase.
I havent seen too many commitments other than Paul,
Mike,Jeff and Me on this site. We going to have enough
bods ?

Date: 2002-05-25 03:34:47 UTC
From: Mike Garske
Topic: 2238 Message: 2855

As of 0000z 25 May 2002, the current prediction, using 90k Burst Altitude, 1000ft Ascent, 1200 descent......

Duration: 124.5 Minutes
Bearing: 92.9 degrees
Range: 39.8 miles

Almost a due Easterly flight......

Anyone get anything different?

Mike KC7DPD

2856. TV02B Flight Announcement

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-25 04:21:31 UTC
From: K7JPS - John
Topic: 2856 Message: 2856

Treasure Valley Near Space Project (TVNSP) will launch flight TV02B.

Flight Specifications:

Launch date and time: Saturday, May 25, 2002 at 0630 MST (1230 UTC)

Launch site: Bully Creek Campground NW of Vale, OR N 44.03 W 117.41

Predicted Burst Altitude: 90,000 ft.

Balloon: 1200 gram latex

Manifest:

Flight Termination Unit / Envelope Cut away
set for 0830, 120 min into the flight

Module 1
APRS Tracker on 144.39 MHz
Call sign KD7INN-11, 30 sec intervals at 05 & 35 past the minute
CW beacon on 145.60, 2 min intervals

Module 2
APRS Tracker on 144.39 MHz
Call sign KD4STH-11, 15 sec intervals at 00, 15, 30,45 past the
minute
APES Camera pointing to the negative Z axis (Straight Down from the Capsule
Photometer
Relative Humidity / Temperature Sensor

2858. Somebody asked....

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-25 04:27:14 UTC
From: Bill Herrmann
Topic: 2804 Message: 2858

for the URL of the new telemetry via FindU CGI

http://www.findu.com/cgi-bin/tele.cgi?call=KD4STH-11&last=96
http://www.findu.com/cgi-bin/tele.cgi?call=KD7INN-11&last=96

will get you any data that makes it there. If you want one to check now...

http://www.findu.com/cgi-bin/tele.cgi?call=KB7WWP-10&last=96

The top two lines are battery voltage and solar panel voltage. It should be obvious which is which.

Last, but not least... The URL for the Cybiko APRS client is http://www.qsl.net/kr1st and he has a bunch of information on what else you need there. Note that you will likely need to upgrade to system pack 57. (Easy to do after you download cyberload from Cybiko's site.) As Jeff mentioned, when you go to http://www.cybiko.com you want to click on classic Cybiko at the bottom of the first page. If you have problems getting set up let me know. I've got a northwest map that I'll post tomorrow and I'm hoping to work on some other maps.

Bill

The launch team will be trying to use Cinnabar (147.24) for voice. Both John and I should be monitoring from our respective homes. Depending on where the balloon goes and the kids willingness I may go mobile while it's on the way down.

Bill

2868. TV02B Flight Status

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-25 14:43:31 UTC
From: Bill Herrmann
Topic: 2856 Message: 2868

Dawned on me about 30 minutes ago that none of us had sent a status for those not in our area... Of course, it's taken till now to get it done...

TV02B launched NW of Vale Oregon just before 0700 Mountain time. It just passed through 70,000 feet and is ascending slightly slower than planned. Right now we're predicting that the cutaway will happen slightly before burst.

FindU is showing good tracks for both payloads. (KD4STH-11 and KD7INN-11) I've also got some predicted landing spots posted. (Best bet is to use the stations near and look for the "Landing" objects.)

2870. Re: [tvnsp] TV02B Flight Status

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-25 16:04:40 UTC
From: Mark Conner
Topic: 2856 Message: 2870

Yes, it was pretty fast. Below 20,000 ft the descent rate was 4000 ft/min, or about 45 mph. Initial descent rate was 11,000 ft/min. Burst was at 1455Z, landing about 1506Z. I'm thinking the chute was completely fouled, or it became detached from the payload.

KD7INN-11 stopped reporting about 69,000 ft. I'm not sure how they were configured - is it possible KD4STH-11 was on the bottom and left formation?

I'm afraid it wasn't just you. The good news is that they are in the process of recovering the capsule. The bad news is that the parachute is MIA. The overall descent rate was around 6500fpm. I haven't calculated the last descent rate yet.

Initial reports from the chase crew said disintegrated, but detatched is a
possiblity.

>KD7INN-11 stopped reporting about 69,000 ft. I'm not sure how they were

Watching too many balloons at once. Operator error.

I have sth-11 sorted out now.

The story on the NY balloon is that the GPS module
on two meters separated and has now landed, and the
10 meter payload is still rising on the balloon.

The top GPRMV sentence has a descent rate of 7.5 m/s, or 1476 ft/min. The bottom one has 3.2 m/s, or 629 ft/min. However, in the time period bracketing the 7.5 m/s report, the payload fell more than 1200 meters in one minute, or 20 m/s. I don't quite understand the differences reported here.

Mark,
Something to keep in mind here is that altitude is the LEAST accurate parameter in any NMEA sentence from GPS receivers, even with selective availability turned off. WAAS-capable receivers have reduced this error, but its still not exact.

Altitude is the least accurate of the three dimensions, but known GPS error characteristics can't account for this large of a discrepancy. The results I get on NSTAR flights from finite differencing the altitude reports vs. the vertical velocity from the PGRMV sentences are far closer than this. There should not be an order-of-magnitude difference.

2883. Status, 25 May

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-26 00:40:16 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2883 Message: 2883

I'll edit the data file a bit and post the results in a day or two. At lunch I was able to load a program into the flight computer and retrieve the flight data from the flight data recorder. My capsule, Kepler II, appears to be working. I have a cracked airframe, but everything else appears to be working. The APS camera has a dinged corner that appears not to effect it, functionally. The external experiments were recovered on one piece, and may be fine, also. I believe the capsule stopped transmitting data because the TNC battery pulled lose.

The parachute and shrouds ripped off the capsules. It was suggested that the parachute opened at high speed and the snatch ripped it off. The lanyard is visible in every picture but the last, so it may have twisted around the parachute during the ascent, preventing the parachute from opening.

It was an easy launch, chase, and recovery.

Paul

I believe that that picture is at the recovery site. The capsules are close to their respective owners. The red capsule (Jeff's) was the most damaged. It isn't easy to observe in the picture, but the top and everything above it parted company with the capsule. If you look closely you can observe some black tabs with the load rings at the bottom. The top ones are MIA. Jeff had most of the electronics in a sandwich stack at the bottom of the capsule. IMO that saved them from also being MIA. I'll let Jeff and Paul fill everybody in as they have a chance to check their equipment over, but it's remarkable to observe how well things held up to an uncontrolled plummet.

Bill

2885. Capsule conditions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-25 23:59:45 UTC
From: Jeff Melanson
Topic: 2885 Message: 2885

Hi All,

The capsule frames took some damage but as you can see in the group picture they were not smashed to bits as some of us expected. Apparently the parachute was separated from the capsules at cut down time. Stephanie has a good idea of why this may have happened. On launch one of the lanyards became caught on the ring and we had to let it go with the capsule. Paul's pictures show that the lanyard and kite winder hung straight down for the ascent. The cutdown device operated before the balloon burst. That means that the lanyard which was still attached to the balloon and hanging below the capsules continued to rise while the capsules started to fall. Stephanie suggests that the kit winder snatched the parachute on the way by like a sky hook and that action may have ripped things apart.
The two capsules came down together. In the group picture take a close look at my capsule (The red one). You will notice that the tie points at the top of the capsule are missing. On the left corner you see a piece of torn fabric over the capsule. One of the bottom corners is also torn but you can't see that in the photo. Something violent tore this up. Those tie points were pretty strong. When the parachute was torn away it took my capsule cover with it. My GPS was out of the capsule and hanging by the wires. The rest of the electronics remained inside. On impact the GPS was smashed beyond use. The radios and Flight computer survived. The TNC took some physical damage but looks to be in good shape. It powers up but I still need to do some inspecting and testing. The radios, flight computer, and TNC were packaged in a three level pallet in the bottom of the capsule and were fairly secure. This is what probably save them. The GPS was in the top of the capsule and fell out when the cover was pulled off. It was in a Styrofoam box but that was nowhere to be found. It appears that although my capsule was above Paul's on ascent it was under his on impact. Paul's capsule took less damage than mine. We think my capsule helped break the fall for Paul's capsule. I'll let Paul describe his damage. My tracker worked good all the way up but after the parachute separation we didn't get anymore reports. No surprise here. Paul's tracker worked all the way to impact and we had a good fix on it. It landed (impacted) in a safe place and was an easy recovery.

I've just uploaded www.webpak.net/~bherrman/TV02B.zip

It contains my logs of TV02B in both text and APRS+ format. I also through in the quick Excel spreadsheet I did with the descent rate and altitude.

It's in Excel 2000 format, which Excel 97 will also read. If you need it in something else I may be able to convert.

Wish I was with you. Deb and I watched the Internet postings of the flight since right after launch. It was almost in slow motion until the descent started then wow, it wanted to come home. Couldn't believe how fast it was descending.

As the casules headed for Emmett I was trying to tell you where to head and some short cuts to take, but, alas you couldn't hear my shouting.

Glad you were able to recover the remains of the capsules. Paul, you should check to see if you have the fastest decent.

Ah, those are the "after" pictures. When I first saw them, I thought they were "before". I figured "after" would have involved a stick and a spoon for recovery implements.

Glad the only loss seems to be a chute and some styrofoam. My last ballistic flight cost me a camcorder.

These lanyards seem to cause a surprising amount
of trouble.

I don't think EOSS ever uses them. They tried them a
long time ago and didn't like them.

2892. Re: [tvnsp] Capsule conditions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-26 03:30:28 UTC
From: Tony Barrett
Topic: 2885 Message: 2892

So who needs parachutes! :-)

With a little airframe refinement we could crash land all the time, except for the fear of landing on someone. And the parachute makes it easier to watch the descent and find the capsules after touchdown.

Those lanyards seem to be a frequent problem. Might be an opportunity for some improved engineering. Maybe the lanyards should be wires that operate some ground powered cut-down devices, with the cut-down devices falling to the ground for recovery at the launch point. When we're ready to launch we just flip a switch and all the lanyards are cut away. We'd have to think about ways to ensure the falling cut-away device don't snag things on their way by. Maybe we make them the right length so that at the launch angle they are away from the parachute and package. Then the short strings that fly won't hurt anything.

Rather than the attachment rings we might think about a parachute strap / net / basket that is one or two or three continuous nylon strap loops that go from the chute underneath the capsules and back up to the parachute.

I think we learned a lot of good things about airframe design today. Maybe we want a "crush" zone on all sides just to ensure a better survival rate in the case of a crash landing. Rather than just putting everything in the box, every piece with any appreciable mass needs to be solidly secured to the airframe. That way, even if it gets tipped upside down with the lid ripped off, the contents stay in position and continue to function. How about a double pyramid airframe that's designed to land on a point, crush, and absorb some impact. Theoretically you could mount the package above an airbag that deploys when the sensor touches down, kind of like NASA did with one of the recently successful Mars missions. I know. Too expensive and too complicated. But you could put a heavy duty party balloon or two in the capsule under the package that's designed to pop on impact and slow the decent of the electronics.

Some of these middle school science students have solve the problem of packaging an egg to survive a drop from a four story building. We could adapt some of their ideas.

Looking forward to more details on how the electronics survived.

I control my internal batteries by an "external switch". Actually, I just put a plug in the connector. The connector has a switch built into it. When I pull the plug the internal battery is connected and the TNC turns on if the front panel switch is on. You could just put a "PULL BEFORE LAUNCH flag on a string that pulls the plug out of the TNC to act as an "external switch".

I actually use these plugs for the opposite reason. I want to make sure the internal battery does not run down if the power switch is accidentally bumped on. So long as the coaxial DC plug is in place (and the jumpers on the TNC are set right) the plug ensures that the internal battery is NOT connected.

Its an option, something worth considering. A 9 volt lithium will power a TNC for days, even at cold temps.

2900. Another Way of Using a Pager, Garmin 35 vs. Etrex

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-26 04:41:39 UTC
From: Tony Barrett
Topic: 2900 Message: 2900

Hey Guys,

Jake Gier (N7VIV-AE, Congrats Jake!) was listening in on our launch and we chatted about it afterwards.

I remember we tested a pager to operate a cut down device and it didn't seem to work well at higher altitudes. We thought it may have been out of transmitter range at higher altitudes, maybe due to the radiating pattern of the paging transmitter. Jake was suggesting that we use the pager to turn on and off a recovery beacon. We know these pagers work pretty well at ground level. Dane Delucia (AA7YE) gets pagers for about $5 and he has a really simple "toggle" circuit that turns an external device on and off every time the pager is activated. Jake's thought was that we could conserve battery power in the recovery beacon by only turning it on when we wanted to begin recovery operations. Once we got a bead on it we could turn it off until we got closer, then turn it back on to take another position fix. Some TNCs (KPC-3s I think) can operate pagers. I know some repeater controllers also page. Heck, maybe even some HTs page (my Yaesu FT-530 has a paging function, but maybe its not the same.). Some pagers are easily moved into the 2M band. The recovery crew could carry a portable paging transmitter (just a TNC and maybe a laptop tied to a mobile radio) in case the capsule touched down in some valley not covered by a regular paging transmitter.

Thanks for the suggestion Jake. If I missed something, or got it wrong, please let me know and I'll be happy to make amends.

This next one is my idea, so don't blame Jake if you think its silly. Another reason to use Garmin 35s instead of Etrex units: if the capsule is found by someone else, Garmin 35s are less useful (with no display and no controls) to the casual user than an Etrex or GPS III or similar device with a built in GUI. Its more likely someone will call us to return something they can't really use or sell. You know I've never had the power switch bumped on my Garmin 35 (since there ain't one! :-)). They're waterproof too! Made for marine use. Since they're potted, with no "glass", and about the size and mass of a mouse, they may even survive crash landings. They sound cheaper (in the long run) all the time. No mods required. Two serial outputs. Wide voltage range. Fast acquisition.

73,

Tony

Thinking about the Indy 500 I'll watch tomorrow. Those cars are made to come apart in a crash to dissipate energy and minimize damage. Maybe a more rigid airframe would make things worse. Perhaps these airframes did exactly what they are supposed to do and minimized the damage to other parts. Most of the electronics still work. One the other hand, they do use wheel restraining cables (a recently added safety measure) and seat belts to keep things from getting too far away. Maybe the GPS would have survived with proper restraint. Pure speculation, but the same laws of physics apply. Restrained objects, that are free to move a controlled amount, survive crashes better.

Cool pic!

Thanks,

Tony

I noticed that on the back of the photos Paul had developed, they
are numbered from 1 to 33 but if my memory serves me, wasn't there 34
frames shot by the camera? Did the last frame jam and didn't take a
picture but the camera said it did anyways?
I was also wondering if Paul can determine, using the flight
data, the time, altitude and lat/long of each picture that was
taken. I'd like to label each photo with the info. Thanks

...As an after-thought, I take it I won't be getting my budget 9V
battery back any time soon huh? I'll just have to get some more :)

Jeff,

What is this kite winder like? Size, material?

If this is some kind of rigid plastic thing, I think the
practice of allowing objects like that to go up, even
by accident, is not a good one.

Seems like it's just looking for trouble.

> So how do you launch without lanyards?

Oh, that's an easy question. Just with the "load line" beneath the balloon. This lanyard method seems to be a Kansas thing.

Here's a complete account of the EOSS philosophy from its president and technical officer, Mike Manes. It's in response to Mark Conner's recent bad lanyard experience. Both Conner and Manes posts are edited.

Notice Mark abandoned the lanyard scheme and then had no trouble.

Mike thinks the no lanyard method is the "safest and most reliable."

Hank

> a lanyard fouling again.

Mike Manes:

Hi Mark,

EOSS tried that "lanyard" release once before (we called it a painter line, after the naval tradition of the guy who thought it up). And we had the same failure: the friction of the painter pulling thru the load ring cut thru the

load line.

Since then, we've learned that the safest and most reliable way to launch is to get the payload handlers lined up downwind, per the pibal, to hold the balloon by its nozzle and simply let it go on the count.

The payload handlers attempt to get each of their payloads directly under the balloon when it pulls free to prevent penduluming into the ground. This method works dandy anywhere from dead calm up to 15 kts, and it also avoids damage to any cables or connectors running alongside the load line.

We abandoned it only for the second attempt on 02-B, mostly because the lanyards were a tangled mess afterwards and the winds were so light that day. We did the lanyards again for 02-C and had no problems.

We do a closer eyeball check of the lanyard positions before release, and we have the free ends "downwind" of the stack. We also release both free ends simultaneously.

I attribute our bad experience primarily to a frayed end of the lanyard *before* release, plus being positioned so that the free ends blew against the stack and load line.

Mark,

We have used a loop at the end of our lanyards that slip over the end of a piece of PVC pipe to hold the lines until it's time to release. We slip the loop off the end of the pipe to release it. We release one at a time. It is this loop that seems to occasionally snag in the ring. We are thinking that we should remove the loop by cutting the lanyard at launch time or wrapping the lanyard around the pvc pipe instead of tying a loop. How do you do this?
On one occasion our load line was melted through by the friction of the lanyard pulling past it. This is the time that the sucker winds crept up on us and yanked the balloon away. If it wasn't for the winds we would not have had the problem.

It would seem to me that the problem with holding the load line to raise the balloon is the 15 pounds of pull from the balloon. You would definitely want to have your gloves on and if you accidentally lost you grip on the line it would yank the payloads off the ground and hopefully not break anything. The lanyards are a gentle way of raising the balloon, parachute, and capsules. The lifting force is divided among three line handlers.

Consider this for a solution:

Raise the balloon with the lanyards until the payload is suspended under the balloon. Hold onto the payload and remove the lanyards. Release the payload.

Comments?

Do you really think they serve much of a purpose, Mark?

They have been the cause of several substantial mishaps.
Has their use perhaps avoided mishaps that would have
otherwise occurred?

EOSS certainly has a very long record of trouble-free
launches that has to carry a lot of weight.

I believe they do. Maybe not specifically for that
purpose (of demonstrating).

I don't think the lanyard method is very widespread
really, so on the web there should be many pictures of
people just holding on to balloon necks. The lanyard
thing seems to have taken hold in Kansas.

I have a few pictures of me raising a balloon
on its loadline, but that's the record holder
for the smallest envelope to ever raise a telemetry
equipped payload, so we won't mention that midget
balloon again. :) You might have seen beachballs
almost as big.

Hank

2920. Re: [tvnsp] Re: Those troublemaking lanyards

Yahoo group: tvnsp (2000 — 2002)

The gentleness of the release, combined with the additional control of the balloon during windy conditions, is why I still like the lanyards. EOSS has good luck with their methodology, and we'll see a demo of it at GPSL 2002. Maybe after seeing it done I'll be more apt to try it.

We tie loops at the end of our lanyard, and use a crescent wrench (needed for tightening the regulator into the tank) as the holder. We either duct tape or put heat-shrink over the knot. We also fold the ring into the neck, placing the split under the latex. The load line is tied to the balloon side of the U, then the works is taped over leaving the bottom of the ring exposed. That's what we run the lanyards through.

If you get the payload lifted off the ground, and things are otherwise under control, I could see where releasing the lanyards while holding the payload might provide another means of getting around a possible snag. That would give you the ability to resolve the snag or cut the lanyard leaving the minimum amount of string still attached.

I think the EOSS method, as described, snatches the payloads either off the ground or out of the hands of the launch crew. I personally like seeing everything hanging below the balloon before release to make sure everything is untangled, the payloads are still functioning, etc. I think the EOSS payload exteriors are "cleaner" than ours and offer less potential for snags or tangles during the launch process.

My experience has shown less trouble and more comfort with the launch process to use the lanyards. The downside can be mitigated with a little vigilance.

We just did a launch Thursday using lanyards to raise the tow balloon & parachute up. We had the tracking/telemetry payload below the chute & everything tied down with sandbags (the first lanyard was removed as soon as the sandbags were attached). After getting outside the hangar, we attached
a 16' super pressure balloon under the payload and a final transponder/strobe module on the bottom. We used a second lanyard to raise everything up & held the bottom module by hand. It was walked to the center of the launch area and released.

Attached is a photo inside the hangar with the lanyards attached. When I get the next roll processed, I should have outside shots of the second lanyard.

I also scanned in a shot showing the balloon at the door if anyone wants it.

This balloon went to 69,000' and floated around 14 hours, until we cut it down around 10:30 pm. All was recovered & returned to Tillamook.

We lost our first balloon of the season because we tried to launch without lanyards. The wind caught the balloon and snapped our 50lb weak link. Granted, it was a windy morning, but the lanyards would have at least given us a shot at getting it in the air.

Of those who are not using lanyards, how many have the 50lb test line in series? It seems like EOSS flies mainly big packages which do not require a 50lb link (just cutdowns).

Justin,

There are only 33 pictures. The flight computer log that Mike posted is supposed to show how many pictures were taken and the altitude they were taken at. Using the time from the log we could compare this to an APRS log to get Lat and Lon. The first number in each log entry is the log number. There are 137 log entries. The second number in the log is the time. The fourth number is the altitude in meters. Multiply meters by 3.28 to convert to feet. The picture number is the three digit number toward the end of each entry. The first two digits is the picture number. The third digit indicates whether or not the picture was taken at that time. If it is a 1 then the picture was taken at that time. If it is a 0 then no picture was taken at that time. For example if the number is 121 then picture number 12 was just taken. If the number is 120 then no picture was taken. The picture number advances when the next picture is taken. The first picture number is 02. I don't know why the count jumps from 02 to 11 between log entry numbers 25 and 26. Perhaps there's some missing entries. The last picture number in the log is 34. I also don't know what the rest of the numbers in the log mean. Paul will have to explain these other numbers and why the picture count looks strange. Once we know that information anyone can make a list showing the picture count, lat, lon, altitude, time, etc. Mike Garske made the last list for the previous pictures. Someone else can take a turn at it. Paul will be busy this week preparing his capsule and parachute for GPSL 2002. He needs to have it ready before he goes on vacation.

Hope this helps.

>pvc pipe instead of tying a loop. How do you do this?

As long as we're using a piece of pipe rather than a crescent wrench we should be able to have the best of both. A simple clovehitch around the pipe should provide a know that can be released but still leave smooth line to go through the ring.

Note: We should also make sure that the plastic kite winders are NOT tied to the end of the string. I suspect that they unwind to the end in flight and if they weren't tied on there would be nothing left to snag anything. It might also be wise to station somebody with a cutting implement near the line handler.

>It would seem to me that the problem with holding the load
>line to raise the balloon is the 15 pounds of pull from the
>balloon.

...and potentially more than that as illustrated by the picture Hank referenced. I had to chuckle at that picture because it would have been comparatively trivial to launch in that situation with a lanyard...

>Raise the balloon with the lanyards until the payload is
>suspended under the balloon. Hold onto the payload and
>remove the lanyards. Release the payload.

I think this would be very doable in calm winds. It has the same problem as illustrated in that picture in stronger winds. We've talked about a couple ways to drop the lanyards rather than let them pull through. I, for one, think it's time to try them.

Bill

You and Deb missed a fun flight except for the accelerated
re-entry.

Yea,i thought something was wrong when i visually watched the
balloon burst (a first for me). I ran back to the latpop in the
pickup and noticed it had fallen from burst altitude to 58,000ft.
in less than a minute. Everyone said that was "natural", little
did we know ;(

I thought i heard someone shouting ;) Maybe it was someone watching
over us. If the parachute had worked, we may have been doing some rock
and/or tree climbing in the Lowman area.

Anyway, glad you could watch.

Randy,

Were you looking almost straight up then?

How did it look? Was it tiny and hard to see against
the sky or not too hard to see.

Do people have binoculars or small scopes with them
to help spot the balloons?

Hank

Ah, but that's the irony. EOSS can chuckle back with the
last chuckle because they have a perfect 56/56 recovery
ratio.

I'm reminded of the old adage about "the proof is in the
pudding."

We watched the balloon without binoculars. It was just under 80,000 ft and approximately 12 to 14 miles away and getting closer. It was southwest of us. The balloon appeared as a bright white dot. When it burst the bright dot faded to dim white then disappeared. The dim white had to be the pieces of balloon and talcum powder. I wish I was watching with binoculars but it was really neat to see anyway.

2937. Mike Manes on line strength; must read for loophole navigators

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-27 15:44:15 UTC
From: n1ltv
Topic: 2937 Message: 2937

The following is a message to Pierre whose New York HamBONE launch (at almost the same time as Saturday TVNSP) lost a GPS module with transmitter.

An experimental VOR based positioner (a world first as far as I know) rode with the balloon to burst over Connecticut.

Both packages are unrecovered as of today. The story on the "close but no cigar" recovery attempt for the conventional GPS module is particularly vexing. Pierre got to within hundreds of feet of the payload, was getting strong GPS packet bursts from the payload on the ground, but had a laptop battery go dead so he had to make the 1 hour drive back home without a recovery. The immediate area is a walled private estate and horse fields. This is one of the differences with eastern balloon work: even many rural areas are settled.

You can read about that and see maps by going to the yahoogroup "ham-bone."

Incidentally, this Mike Manes message also shows that EOSS probably owns the record for fastest descent.

Hank

Mike Manes:

Rotten luck! Dang! We've had a couple of "independent descents" as well, one from 80,000 ft in 4 minutes. Both were recovered via 2m DF, however. Have you figured out how the payload broke free? If you were using 50 lb tensile line in an effort to conform to FAR 101, then there's the rub. I think Paul Verhage said he had a 50 lb line fail during one relatively modest launch.

Note that the FAR uses the term "impact strength", which allows for use of 250 lb or stronger line, assuming that "impact" means something on the order of a 20 G acceleration of a 6 + 6 lb payload. The idea is for the line to snap if an aircraft hits it, and that will produce a whole lot more than 20 G's!

Jeff

That idea is so simple,i love it. That will alow us to pull the whole package back down if the lanyard would hang up.

That idea is nicer than mine.
Just have 9mm ready to burst the balloon ;)

Jeff,

That's amazing that you could even discern the
"afterburst."

As far as seeing a sight like that, I feel a lot like
the people who would like to see a twister once in
their life. You know the people who travel to Oklahoma
and Kansas and sign up for one of those tornado
chasing tours.

Well I'd like to at least once get to see something
like you described.

I can't understand why there is so little interest in
ballooning, especially in the East. I send out posts
to many email lists about launches in the northeast,
and people are reading the posts, it's just that they
don't really care.

How is it done now? Do you have the loadline unattended
and release from the lanyards? I would have thought you'd
release at the very last minute from the loadline, but
I guess not.

If the release is from the lanyards, is it one lanyard
at a time or all at once?

I'd like it if TVNSP could do a movie of the launch
procedure as currently practiced.

And what about those kite winders? Are those really
necessary?

Hank

2941. Watching the balloon burst

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-27 16:09:03 UTC
From: Mark Conner
Topic: 2941 Message: 2941

I agree with Hank that it's one of those sights that hooks you for life.

The most spectacular one in my memory is one of Paul's KNSP launches (98F). This was a pre-dawn launch, so at burst the balloon was sunlit but the sun had not yet risen at the surface. We were looking nearly south and up at about a 60 degree angle to the balloon, so the sky was rather dark behind the balloon. The balloon was probably 3-4 magnitudes brighter than Venus. In ordinary 7x50 binoculars the balloon and payloads could clearly be seen. I happened to be looking at the balloon when it burst and I could see the payloads fall away, the chute start to open, the cloud of talc and latex shards remaining behind, etc. Spectacular.

On most flights with clear skies, the balloon can be seen in daylight, provided you know where to look. Thin cirrus can make it nearly impossible though. In daylight the balloon burst looks like a star fading out, but if the orientation to the sun is favorable and the sky is clear, you can see the talc/shards too.

This, combined with being in position to catch one of the NSBG payloads (I didn't catch it because I was too busy with the camera), can get you hooked in a hurry.

2942. solutions to snagging problems with lanyards

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-27 16:09:09 UTC
From: n1ltv
Topic: 2885 Message: 2942

How about using a bigger diameter ring to avoid snagging?

How about using two rings, one for the payload line and
a separate one *just* for the lanyards. This should all
but eliminate problems with the lanyards chaffing
the payload line.

Hank

Hey, I know that hangar, I think....what a GREAT facility to prepare and launch a balloon from. Isn't that the HUGE dirigible hangar outside Tillamook ? For those going to Seaside and interested in aviation in any way I'd recommend going there just to be awestruck at its immense size, if nothing else.

Tim, N7UBO

To:tvnsp
Subject: [tvnsp] Lanyards

We just did a launch Thursday using lanyards to raise the tow balloon & parachute up. We had the tracking/telemetry payload below the chute & everything tied down with sandbags (the first lanyard was removed as soon as the sandbags were attached). After getting outside the hangar, we attached
a 16' super pressure balloon under the payload and a final transponder/strobe module on the bottom. We used a second lanyard to raise everything up & held the bottom module by hand. It was walked to the center of the launch area and released.

Attached is a photo inside the hangar with the lanyards attached. When I get the next roll processed, I should have outside shots of the second lanyard.

I also scanned in a shot showing the balloon at the door if anyone wants it.

This balloon went to 69,000' and floated around 14 hours, until we cut it down around 10:30 pm. All was recovered & returned to Tillamook.

Mark,

Thanks for posting your account!

Absolutely mind-boggling. I didn't think it would be
possible to make out a payload and parachute with such
low magnification.

WOW.

Hank

2945. Re: [tvnsp] Re: Those troublemaking lanyards

Yahoo group: tvnsp (2000 — 2002)

Vigilance is the Keyword from your post Mark. We discussed having
a cutting dice available to at least get that hand winder free if
we get a hangup.
I still do not like the idea of dangling line of any kind after
launch.
That is why cutting away that bursted balloon makes such a nice slow
rotating capsule in my opinion.
It is another uncontrolled variable "gotcha" waiting to happen.

With Jeffs idea or others that will surely follow, we need to get the
package back on the ground and get that excess baggage off the
parachete
ring. If we wanted a dangling line we would have designed it into to
the experiment.

Yes the lanyard method is a proven good way to do it,we just need to
abort when things are not right.

Hank,
Yes, I've been there and have the pamphlet around here somewhere that goes thru the history of that hangar (and the other one that burned). IMHO, it was VERY impressive and informative to visit.

Hank,

It was one of those "WOW" experiences for me anyway.
I had no idea you could really see a balloon of that
size and at that height.

n1ltv wrote:

> Randy,
>
> Were you looking almost straight up then?

Actually we were looking at about a 1-2 O'clock
angle to the horizon since we were still in
Emmet,Id at a local gas station.
The tracking report from "Peedy", my
report announcing parrot said it was 18.5 miles
away. BTW, this text to speech feature of APRSplus
is very handy for lone chasers. You can listen to
the action while driving. It announces the
bearing,speed,altidude,distance form object and callsigns.
I do not need to look at the maps until we pull over.

> How did it look? Was it tiny and hard to see against
> the sky or not too hard to see.

Once you located it, it was easy to see. The young
guys with good eyes spotted it and pointed it out to me.
I used a overhead power line and ground spot to reference
from quickly when i looked away to rest my eyes.
It was very white against a beutiful blue Idaho sky.
AS it burst, it was like watching a star
twinkle from the atmospheric dust. It seemed to take
actually a few hundred milliseconds for it dissapear.
It actually (to me) appeared to get smaller in that time frame
i described above. Probably my eyes and brain playing
tricks on me.I know the burst had to be instantaneous instead of
a slow deflation process.
>
> Do people have binoculars or small scopes with them
> to help spot the balloons?
>

Yes we had a couple of people with binocs.
Wished we had a telescope handy, that would have been awsome.
I have more ammunition to warrant me buying a good spotting
scope now ;)

To:tvnsp
Subject: [tvnsp] Lanyards

We just did a launch Thursday using lanyards to raise the tow balloon &
parachute up. We had the tracking/telemetry payload below the chute &
everything tied down with sandbags (the first lanyard was removed as soon
as the sandbags were attached). After getting outside the hangar, we
attached
a 16' super pressure balloon under the payload and a final
transponder/strobe module on the bottom. We used a second lanyard to raise
everything up & held the bottom module by hand. It was walked to the
center of the launch area and released.

Attached is a photo inside the hangar with the lanyards attached. When I
get the next roll processed, I should have outside shots of the second
lanyard.

I also scanned in a shot showing the balloon at the door if anyone wants
it.

This balloon went to 69,000' and floated around 14 hours, until we cut it
down around 10:30 pm. All was recovered & returned to Tillamook.

2951. Re: [tvnsp] solutions to snagging problems with lanyards

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-27 17:01:23 UTC
From: Jeff Melanson
Topic: 2885 Message: 2951

Hank,

The load line is attached directly to the balloon and does not attach to the ring. If I remember right the ring is two inches in diameter. The only time the load line gets damaged is if the lanyard gets wrapped around the load line. This is usually associated with windy conditions and doesn't normally happen. If we pay careful attention to this we can unwind any tangle by moving the line handlers around to unwrap it.
Two lanyards are passed through the ring. On line handler has the ends of both lanyards. The other two line handlers have one end of each lanyard with the kite winder. The kit winder is used to slowly raise the balloon. The load line lifts the parachute off the ground. As the parachute rises the shroud lines lift the two payloads. The load line and parachute are well above our heads and out of reach. We control the payloads and place them directly under the balloon. If everyone is satisfied that all is well we remove one lanyard. It is the line handler that is holding both ends that does this. He/she releases one line and the appropriate line handler pulls the lanyard out. Then we release the second lanyard. The balloon starts to rise as the lanyard pulls through he ring. My suggestion is that we hold onto the payload until the second lanyard is out of the ring then release it. A minor change that will work well in calm conditions.
What I have noticed is this: As the first lanyard is removed the end (which has the loop on it) sometimes snags as it pulls through the ring. The second lanyard does the same thing. Unfortanetally on two occasions it hung up and the line handler had to let it go. We let go for two reasons. To prevent damage to the load line from any possible tangles and to prevent injury to the line handler. If there is a slight breeze that can be quite a tug-a-war for the line handler to try to hang on.
I may have a video that shows this process. I'll view it and see if it's there. If I remember right the video was taken on one of the occassions when a lanyard snagged and went with the balloon.
If you will be at the GPSL you will also see how this is done.

Here is the second photo. I should be getting the second roll processed today.

We used a second ring at the two places we used lanyards. This is to keep away from any lines that support the flight train. It does add weight to it, but not enough to worry about.

Jeff,

Okay, I thought from comments Mark has made in the past
one ring held all his lines. Maybe he in fact does his
NSTAR that way. We'll soon hear from him.

He sent me a tape a ways back of an NSTAR launch but the
fine details of the lanyard procedure are not too clear
from viewing the tape.

Thanks for spelling out the details. I have a totally
clear picture now of how KNSP does it .

For NSTAR, we do not attach the load line to the ring. Only the lanyards go through the ring. The load line ties off the balloon neck and hangs separately (though often it does go past the ring).

As I have been reading along, I remember vividly the mishap that NSTAR narrowly averted the end of March when the lanyards burned through the load line. I feel that the lanyards are necessary to maintain control of the balloon, and using the load line to launch is only a viable option in absolutely calm conditions.

That said, would a short section, only say 6" to 12", from the balloon neck down be something that the load lines cannot burn through. Say thin cable? Then the lanyards, if they did rub it as they passed through the ring, could not hurt it. The the load line would attach to the cable.

Just my 2 cents worth thrown into the pot.

Doug,

I like the idea of a no burn section. What about a different kind of string that doesn't have a problem with melting due to friction? It just needs to meet the same requirements as the load line. Perhaps it can replace the full length of the load line. That way there's no extra attatchments to make.

Why so slow? Isn't terminal velocity around 120 mph?

Sounds like we think it burst before it was cut down, correct?

With no parachute, what limited the speed to 45 mph?

Do you still trust those radios after such a crash?

2963. First Results

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-27 21:28:51 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 2963 Message: 2963

I made copies of the graphs I put together from the flight data. I'll make several copies today and drop them off at Jeff's this afternoon. Jeff, please bring them to the next meeting. Included with the graphs are the measurements of the batteries and a log of altitdes the pictures were taken at. The first 10 pictures are estimated altitudes from Stephanie's log. There's also a page with the data stored in the TNC (the last record before I shut off the capsule). Bill, I have your photos. They cost $5. I have a 5' parachute at home. I'll use that at GPSL and keep my capsule down to a single module (or a second on carrying a few patches and a t-shirt). After I get back, I'd like to get the parachute from Mike and get it sewn.

First, the flight data recorder. Notice the file's first records have a time stamp of 15 hours, but after about 20 some-odd records, the time stamp changes to 13 hours. Upon impact, the flight computer restarted itself and began writing new records from the beginning. so the first 20 some-odds records have been overwritten by the landing. To get a more accurate flight log, cut the first set of records out and paste them at the end. When you do this, you'll see there's a 10 minute gap. This is because the flight computer remains in preflight mode for the first ten minutes.

I didn't bring a copy of the log to work today, so this is from memory. The data is formatted like this....

Record #,Time (UTC),Altitude (meters),Speed,Heading,ADC voltages(you want the first two),pictures,experiment results (RH and photometer).

I have yet to calibrate the RH sensor and the photometer suffers from pointing sensitivity. I'll play with those numbers later this week.

Second, lanyards.
We will not throw the capsule up in the air like the National Weather Service, period. The snatch of the balloon will damage the capsule and break load lines. When I first started in this business, I raised the balloon by it's load line. To see an example of that, see my article in, and the cover of, the Jan 1999 QST. That's a bad way to launch them also. The load line is very difficult to handle when the balloon is pulling up on it at 15 pounds. Also, if there's any wind, the balloon leans the load line into the wind, making the capsule swing like the pendulum that it is once you release it. The faster the wind, the faster you have to run when releasing the capsule. We will continue using lanyards to safely

raise the stack and gently release it. A suggestion has been made to modify the lanyard release mechanism. This we will do, but it may be as simple as covering the knots with heat shrink. I'll look into wrapping the lanyards on a rubber coated dowel. Finger pressure (with gloved hands) may be sufficient to hold the lanyards down. If a problem develops, then you need only release the handle and lanyard unwinds from the dowel. Without a weight on the end of the lanyard, it can't wrap around a parachute in the event that the lanyard decides to go on the ride to near space. The ultimate method is the one used by HABET. Their lanyards are cut at the balloon's neck with the cutdown device. I'll also try to design a simple method like this.

The lanyards are not a disaster waiting to happen, they are very effective and safe. But like any tool, they can cause problems if not used carefully. I have used them for about half of my flights with only two problems. Not a bad record.

Paul

> Why so slow? Isn't terminal velocity around 120 mph?

Terminal velocity depends on air density. As the capsule got
closer to the ground, it slowed down.

> Sounds like we think it burst before it was cut down, correct?

No. Thet were cutdown first. About one minute later, the balloon
burst. The balloon probably burst because the capsule dropped
away in a rather sudden fashion.

> With no parachute, what limited the speed to 45 mph?

Air and low density nature of the capsules.

> Do you still trust those radios after such a crash?

With my life.

From: verhap@occ1.sd01.k12.id.us
Topic: 2965 Message: 2965

All my electronics still work. There were a few cracks in the air frame. I used some hot melt glue and now the airframe is pretty close to what it was before the flight. I plan to use this capsule for the GPSL launch. I will run the capsule for about 4 hours this evening in a final test.

The camera is still functional and still responds to flight computer commands. I'll run a roll of film through it this evening and have it developed.

I need to make a new camera platform. The new one will be a scan platform so the flight computer can position the camera before taking a picture.

The antenna boom needs to be epoxied back on, otherwise, it's fine.

The internal temperature of the capsule didn't drop below below 40 F until just before balloon burst. The darker abrasion jacket appears to have kept the interior about 10 degrees warmer than the white jacket. This may explain why Justin's $1 battery did so well.

I can be ready to launch on Saturday.

Paul

2966. Other Results

Yahoo group: tvnsp (2000 — 2002)

The stratosphere began at an altitude of 42,000 feet on Saturday. The part of the jetstream over Idaho had a peak wind speed of 45 mph and was over 10,000 feet thick (which is deeper than previous flights but with a lower speed). The interior of the capsule stayed significantly warmer than on previous flights. Even during descent, where wind chill has a profaound effect, the interior temperature didn't drop below freezing. The PGMRV sentences indicates the capsules fastest descent speed was 6100 feet/min. The GPGGA sentence indicates the fastest descent speed was 5500 fpm. The difference is that some GGA sentences are missing in logs whereas the flight data recorder records all data. The altitude graph is a bit steeper than usual during the descent.

I even wonder if the heat shrink might be prone to snagging.
But, instead of having loops in the end and holding them with a rod, wrench, or whatever,
you could have several wraps of both lanyards around the dowel without loops, knots, etc.
They they should slide through smoothly. Of course, something would have to be done the bare ends so they wouldn't unravel. But if you are using nylon lanyards you can heat the ends to fuse them together so they don't unravel.

Or, if you have loops in them, have both loops together on a rod or whatever, and the person
holding that could just wield a large pair of sissors to cut both lines at once. No knots etc,
and the unraveling should be minimal and tie a new loop in the end after launch for the next one.

A cut down device at the neck of the balloon would be great, but it would have to cut instantly on command, otherwise you would be waiting for it to release and might not be prepared or caught off balance when the balloon launched!

I tested my radios at the recovery/crash site. They were still in the foam pallet package after the impact. They test good and I have no problem using them again. My TNC powers up but I need to do a little more testing and inspecting. The flight computer had three bent pins where some connectors were pulled off. These were easily straightened. It's also in good shape. My GPS is toast. I sent an email to Garmin and told them what happened. I gave them a link to the TVNSP web site so they can see what we do. I asked if they would repair it for the advertised $59.00. I'll let you know what they tell me.

Terminal velocity is also dependent on size, shape, and weight of the object falling. A man falling in the prone position (arched) has a terminal velocity of about 120 mph, but falling head-down it's closer to 180 mph - in the latter case the same weight has a smaller surface area for the atmosphere to drag against.

Parachute-borne objects have a terminal velocity too - it just produces a more survivable one.

Isn't 5280 feet / min. around 60 mph? Seems like more than 45 mph. And even 60 mph seems unreasonably slow to me (by about a factor of two), but then I don't have any data.

Isn't 79,000 feet about 15 miles up? I'll bet the crash site was less than a mile above MSL. So a 14 mile fall in what, 11 minutes, ... Isn't that closer to 75 mph? 6100 fpm is 69.3 mph. Still seems slow to me. If a prone man falls at 120 mph, or head down at 180 mph, and mass is not a factor, just drag (remember the experiment off the Leaning Tower of Pisa?) ... Guess I'm still questioning our data.
5500 fpm is 62.5 mph.

Tony,

Taking the average speed from burst to ground will always
give a higher rate than the speed on approaching the
ground because parachute or no parachute, the payload
in thin air is booking.

It's easy to see with a graph. I've attached one I made
Saturday of the dropping payload.

The left hand red line is the descent speed at a high altitude.
The right hand is the descent speed close to the ground.
The green line is the average over the whole flight.

Actually, it's the slopes of these lines that are indicative
of speed. Notice how the green line is steeper than the right
hand red, but less steep than the left hand red?

That shows the relative sizes of the three types of speeds.
The peak speed at height is MANY times higher than the speed
of the payload as it hits the ground, and higher than the
average speed for the entire descent.

When I straighten out the graph I'll give specific numbers.

Hank

From: Zack Clobes
Topic: 2966 Message: 2975

Here's my data as I got it from Findu.com Saturday morning

Time Secs into Flight Alt (m) Rate (m/sec)
144959 6661 23354 210.36
145059 6721 23559 205.5
145158 6780 23749 192.92
145259 6841 23935 182.46
145359 6901 24121 186.8
145459 6961 21585 -2536.8
145558 7020 17735 -3915.05
145759 7141 12545 -2573.21
145859 7201 10827 -1718.3
150059 7321 7664 -1581.5
150159 7381 6284 -1380.6
150259 7441 4945 -1338.1
150359 7501 3642 -1303.3

It's kind of hard to read without separating it into colums, but the last column is the rate of ascent/descent in meters per second. It starts out a few minutes before the package started falling. At 145459, you start to see a negative rate of change in the altitude.. it's not that great from the data provided here because the capsule was most likely still climbing during part of that minute.

Almost a minute into the plung, we are dropping at almost 4000m/s which works out to be approx 145mph. The impact is slightly softened by the "re-entry friction" that someone was mentioning a few messages back when the air gets thicker.

Density (and therefore mass) is a factor in terminal velocity - that's why we had to goto the moon to see a feather and a ?rock? drop at the same rate.

2978. Impact velocity

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-28 03:18:22 UTC
From: Mark Conner
Topic: 2978 Message: 2978

Here's a repost of what I sent earlier. The delta between 15:03:59 and 15:04:59 is 1216 meters, or 3989 feet in one minute. That's 45.3 mph.

I still wonder about the PGRMV velocity reports, as it seems those are too slow by at least a factor of three. Can someone tell me when the PGRMV sentences were transmitted relative to the telemetry and RMC sentences (was it X number of seconds later)? Wish I had some time to crunch the data a bit more.

- Mark

KD4STH-11>GPSPO,WIDE3-3:$GPGGA,150359,4401.8994,N,11629.9003,W,1,08,1.2,3642.1,M,-18.2,M,,*4E

KD4STH-11>GPSPO,WIDE3-3:>TV02B R-136 Status: 1000/-V Descending

The top GPRMV sentence has a descent rate of 7.5 m/s, or 1476 ft/min. The bottom one has 3.2 m/s, or 629 ft/min. However, in the time period bracketing the 7.5 m/s report, the payload fell more than 1200 meters in one minute, or 20 m/s. I don't quite understand the differences reported here.

2979. Kevlar line/rings

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-05-28 03:56:58 UTC
From: Mark Conner
Topic: 2979 Message: 2979

Is Kevlar line more abrasion resistant than nylon? I believe I've seen Kevlar sold as rigging for tower guy wires and such. Nylon line (esp. the braided stuff) has good shock absorption as it stretches nicely when loaded. Keeps knots better that way too. Haven't seen what the cost of it is, though, but might be worth it to have a few feet of it near the neck of the balloon on the load line.

Another possibility is to use a different type of line for the lanyards. I think polyethylene line has a much smoother surface and may not have as much friction when it encounters nylon. But it may be expensive or unavailable in small diameters.

I use a 2" ring for the lanyards. I've seen bigger used, but can't remember where. I don't think the diameter makes a lot of difference. However, most brass rings I've seen are not continuous bits of metal, but are instead a wire bent in a circle and sometimes welded at the joint. That joint can be rough enough to snag a line, esp. if that line is under some tension.

Tony-

The super pressure balloon was filled with purified gas to do a Carbon 14 baseline. 80% of all carbon 14 is produced in our upper atmosphere (or so I was told last week by the scientist), but it has not ever been properly tested. We lifted a gas up there & left it at a known altitude for a set number of hours. Upon retrieval, the gas is pumped out & analyzed to see the rate that it was produced. Or something there about.

The super pressure balloon is a spectra shell with a bladder inside to hold the gas.

The PGRMV sentences where sent 30 seconds after the minute.
The GGA was sent at 0 seconds, followed by the RMC at 15
seconds. The contents of LT4 where sent at 45 seconds after the
minute.

> Is Kevlar line more abrasion resistant than nylon?

I believe kevlar is more abrasive, so it cuts better.

I'm going to look into a woven line, rather than twisted. The heat will be heat sealed to prevent fraying. I'll make lanyard holders from dowels covered with rubber tubing. This way there is no loop or knot in the lanyards to snag.

On our rings, I wrap tape around butted joint of the ring. I also try to position the joint at the top of the ring.

I have three more graphs to give to Jeff this afternoon (he said something about my camera and an exchange of hostages). The RH trend shows RH increasing to a max at 40,000 feet and then decreasing. At 60,000 feet the RH is as low as it was at 25,000 feet. At 80,000 feet is was significantly drier. Once I get this sensor calibrated, I'll generate new graphs.

I reserved HobbyTown for Sunday. I can't make that meeting, but Jeff will have copies of the graphs for everyone.

Topic: 2986 Message: 2986

I'm looking for the case for the CD we sent up on the last flight.
Jeff, is it in your truck? Also, we'll need to print a label for the CD.
Can some one do that? Is there a good place to store such
things? Perhaps a VOI archive? If not, I'll hold on to it.

IS TVNSP interested in owning a geiger counter? I'm trying to get
mine replaced. I may be able to get an educational discount.

That brings to mine cameras. Is TVNSP interested in purchasing a
APS camera? We would get it modified for flight computers.

The ultimate goal is to have flight ready instruments for group use.
Once somneone has their capsule ready, they could borrow an
instrument for their mission. I think this will encourage people to
get hteir airframes and flight computers ready (I'm trying to shame
everyone into getting their stuff put together).

I'll make the PCBs for a temperature sensor array for group use.

From: Tony Barrett
Topic: 2986 Message: 2991

Hey Paul,

I was thinking about your temperature / RH sensor boards. I think Stephanie ordered one of the simpler types that won't take the 555 timer.

Are the two boards about the same size? Would it be possible to load the "simple" circuit components in the 555 board? Would you ever think about modifying the board so a single board could be loaded either way? There is often times a certain advantage to flexibility.

I'll bet I could make the 555 board work like the simple board, but not the other way around. If there wasn't any appreciable size or weight penalty I think I'd go for the 555 board (though I really don't think I need either right now).

Just me rambling, ...

That could be done. There wiould probably be a few jumpers to
set, but otherwise, that would be pretty easy to do.

Good idea.

Zack, the -11 is the SSID for a balloon icon in WinAPRS......

As Tim explained it implies the balloon icon. However, it's one of three ways of setting that icon and the others can override it.

http://www.dididahdahdidit.com/text/symbols.txt is one of many locations that have the symbol tables online. They're also in an appendix of the APRS Spec.

GPSC47 also works in place of GPSPO when used as a TOCALL. If either of those are specified, that will take precedence over any SSID convention.

SSID is used to determine icon if no other means are used. Using -11 probably was a convention set up in the early days of APRS, just like -9 is a car, -14 is a semi, etc. Using -11 even in combination with the GPSxyz will help receiving stations determine quickly that a station is a balloon - I've seen few instances of ground stations using -11 for their SSID.

There's also a /O that you can send with the packets to specify a balloon. My only complaint about APRS balloons is that the icon is a hot air balloon. Come on! Hot air balloons are wimps!

Stephanie-

The KPC-3+ wiring is as follows:

9-pin M
1---------- Tx (mic jack)
2---------- GPS in port 2 (KPC-3+ for aprs only)
5---------- Rx (spkr jack)
6---------- common
9---------- power in/out (if used) jumpers needed

And the jumper J9 must be set for 'HT' (this has the resistors/caps built in)

3013. Wanted: Crystal for my TNC

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-05 23:16:16 UTC
From: Jeff Melanson
Topic: 3013 Message: 3013

Hi all,

I'm getting frustrated trying to find this crystal.

HC49/U 3.1872 MHZ

This is the bad crystal I told you about that causes my TNC not to receive. This crystal is also used in 1200 baud modems. It is not listed in any online catalogs that I can find. I've tried several sources. I called Kantronics and spoke with two people. The technician said I could get it from the sales department but that the minimum order was $50. The sales department said they don't sell individual components and sent me to Digikey. Digikey doesn't have it. I called Ecliptek corp. (they make the crystal) and they sent me to there distributor which is Mouser. Mouser told me it was a special crystal and they could get it made but I would have to buy 500 of them! I have tried other online sources but no luck. I suppose I could look for an old 1200 baud computer modem and see if it has the crystal or perhaps an old TNC. Does anybody know where I can get this crystal?

modems. It is not listed in any online catalogs that I can
find. I've tried several sources. I called Kantronics and
spoke with two people. The technician said I could get it
from the sales department but that the minimum order was
$50. The sales department said they don't sell individual
components and sent me to Digikey. Digikey doesn't have it.
I called Ecliptek corp. (they make the crystal) and they
sent me to there distributor which is Mouser. Mouser told me
it was a special crystal and they could get it made but I
would have to buy 500 of them! I have tried other online
sources but no luck. I suppose I could look for an old 1200
baud computer modem and see if it has the crystal or perhaps
an old TNC. Does anybody know where I can get this crystal?

Because this group is open for anyone to sign up, someone joined the group today specifically to poste the SPAM. Which is against Yahoo's policies.

I have submitted an abuse complaint to Yahoo Customer Care and they will be looking into it.

This has been going on with increasing frequency. I've had two other Yahoo lists spammed in this way. Basically the person gets a Yahoo ID (usually with a yahoo.co.uk e-mail), finds groups that are open to join, then uploads a dumb-*** link and announces its existence.

My guess is that someone's come up with a way to script all this because it sure seems like the hardest way in the world to spam otherwise.

I've set two of my lists to require moderator approval to join - anyone with a suspect e-mail address will be queried first.

3026. Meeting's

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-07 22:40:37 UTC
From: John Knapp
Topic: 3026 Message: 3026

I have been having major problems mailing to the
group. I have tried to send this out about three times
and it isn't going anywhere. Anyway, hopefully this
will work.

JohnK

The next meeting of TVNSP is scheduled for June 16. I
was to give a class on
Balloon prediction but unfortunately will not be able
to make the meeting. I
will do the class at the next regularly scheduled
meeting, June 30.

Scheduled Meeting Dates are:

June 16, 30
July 14, 28
August 11, 25
Sept. 8, 22
Oct. 6, 20
Nov. 3, 17
Dec. 1, 15, 29

Hope this helps with the confusion on the meeting
dates. I do not have a
current set of dates for launches, someone will have
to help me with that.

>
> This is the bad crystal I told you about that causes my TNC
> not to receive. This crystal is also used in 1200 baud
> modems.

In only 1200 baud modems that use *this* particular company's
(TDK) IC. The old TI IC used in KPC-3s was around 4 MHz,
and another IC company uses 3.57 MHz (hooray for them).

> It is not listed in any online catalogs that I can
> find.

It in Allied electronics online in multiples of 500.
Same Ecliptek outfit.

> I've tried several sources.

Jeff, you can forget about finding it outside of Kantronics.
The TDK Company (Japan) FAQ on this mentions Mouser.

>Does anybody know where I can get this crystal?

You're going to have to have one made for you. Jan might be
a pretty good place for that.

Just about all crystals used to be made this way and there
was no such thing as stock catalog crystals (except for a few
even numbered ones like 100kHz and 1 MHz for frequency
standard use, and later for CB channels) until microprocessors
came along.

They're all made the same way except if a big run is made of
one frequency they get dirt cheap. This one you're looking
for is under a dollar each for 500.

I have found a 3.2 MHz one for 50 cents from BGMicro, which if
this were asynchronous serial data would be plenty close enough,
and it might even be for short synchronous as AX.25 is, but I'd
feel better with hitting it right on the nose.

To be it's a disgrace that Kantronics won't even consider
selling it for $10 or $12, but that's how Kantronics has
gone lately.

Hi John,

Stephanie can't join us until the July 14th meeting and I
know she wants to learn this. Can we accommodate that?

The next launch will be in Aug. We will try to pin down the
details of this launch and any others at the next meeting.

Stephanie,

So far as I know, the only way to buy one is directly from Garmin. You have to call and ask for their Aviation Department. I think they're around $139 plus S & H, maybe $15. There are three models. The GPS35-LVC is a "Low Voltage" unit (3.6 to 6 volts) with CMOS compatible output. The GPS35-LVS is the same unit but it has bona-fide RS232 signal levels. The GPS35-HVS also has the regular RS-232 I/O lines, but runs on 6 to 40 VDC.

73,

Tony

Jeff and Steph.

I'm just now catching up on my email. Sorry for the late reply. I'm here at work right now,so i will look tonight on my laptop for the data. I hate to loose my reputation for always having the best altitude data.

I'm jealous of Pauls rampack that saves the data directly from gps and controller :-) I thought it had the best recorded altitude?

3041. Garmin 35 HVS for $80

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-10 17:43:26 UTC
From: Stephanie Steele
Topic: 3041 Message: 3041

Hi group,

I have found a source for the Garmin 35 HVS for $80. The guy has 20 of them at that price. I know, I wish they were the LVS too but is anyone interested in the HVS at this price? If so, let me know and I'll put you in touch or see if we can do a group purchase to save shipping.

I am interested. I think the HVS (HighVoltageSource) is the best choice anyway. It can be used with other 2vdc systems (cars, etc). It is highly likely that there will be some 12vdc requirements in the package anyway. Current use is close to the same in both cases.

Stephanie,
I'm interested, but a bit skeptical.....are these NEW (with full factory warranty) units or refurbished ? I don't think Garmin sells them even in very large quantities for less than about $120.....

I wouldn't exactly call this official. My APRSplus History file log
shows the following high altitudes:

KD4STH-11 (Paul's capsule) 79,198 feet
KD7INN-11 (Jeff's capsule) 79,195 feet

Interesting to note that Paul's was the top and Jeff's
the bottom capsule in the flight configuration.
I know altitude is the least accurate calculation of a gps vector,
but at least the two gps's were in agreement in their inaccurate
reporting ;-)

I think i would prefer the low voltage one for ballooning.
It draws a lot less current than the higher voltage one according
to the spec. sheet @.

http://www.garmin.com/manuals/spec35.pdf\

Maybe one of the engineer math wizards could jump
in and make a calculated power usage comparison
report on the two.

It is still a great price for any other application that has
a beefier power supply. Hmmm.. my tax rebate money is still
unspent :-) Stephanie, i hate it when you find these good
deals.

BTW I just missed a good deal on a
Rand Mcnally gps for $40. I think they are magellan's,
so no great loss,(cost wise) if not recovered
heaven forbid (or is that near space forbid).

This is the description furnished by the seller.

This model of GPS35 is 10-32 V and it has (2)232 signals. One of the
Rs-232 is for NEMA and Configuration, the other is for the differential.
It has a 1 PPS, Power, GND and Battery Backup wire.

3048. Garmin GPS35 HVS for $80

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-11 07:29:49 UTC
From: Stephanie Steele
Topic: 3048 Message: 3048

I have received way to many questions about these units to answer individually. In order to answer everyone's questions I will do this one post. Here is what seller is telling me about them.

They are reported to be all brand new units that he bought as 'surplus inventory' from a business that was closing them out. He is representing them as the Garmin GPS35 HVS TracPak units that are sold elsewhere for $160. He has none of the LVS models only these. I verified with him that these are the 'high' voltage models and he reports that hs is using one in his own vehicle and it works fine. These would be useful for trackers, or vehicle based installations where you do not need a display. They could also be used for ballooning as long as you can feed them voltage between 6-40 volts at 870-1000 mW. This compares with 120-140 mA for the LVS units. These figures are direct from Garmin's own literature.

For the person who is "skeptical" I don't know what to tell you. I will order one for you if you want one and if not then that's ok too.

I think this answers everyone's questions. If not, let me know!

3049. Garmin GSP35 LVS

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-11 07:42:26 UTC
From: Stephanie Steele
Topic: 3049 Message: 3049

Now, to confuse the subject even further, I have found a source for the LVS and LVC models from another source. There are 14 of the LVS and 8 of the LVC available and I am still negotiating for the best possible price on the LVS units. These are reported to be brand new units. I'll post the price once we settle it but it will be more than the HVS units previously offered but much less than current 'street' price.

.....and for the skeptics, no, I'm not making anything on any of these!

Stephanie,
I suspect the problem is because of my use of incredimail. I can't think of any other possible reason, so I decided to send this thru the list to see if that works better for you. And yes, I would like to get one of the GPS 35 units.....I've had good experiences with both the 35 and 36 (we integrate the 36 into electronic fish-finders at work). I'll be interested to see if the warranty registration card is in the box....sounds like it will be.

Thanx, Tim.....

Subject: Email problems

Hi Tim,

I'm not sure why, but everytime I get an email from you it locks my mail client up when I display it. I can read your message but once it is fully displayed I have to kill the mail program to move on. I suspect it is related to the HTML code you are sending your messages in. Not sure what if anything you can do about this but I thought I'd speak up. Maybe I'm not the only one.

3051. Garmin 35 current and power requirements

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-11 16:31:47 UTC
From: n1ltv
Topic: 3041 Message: 3051

There has been the implication that the high voltage GPS35
needs 12 volts: not true. It will run on as little as 6 volts

> I think i would prefer the low voltage one for ballooning.
> It draws a lot less current than the higher voltage one according
> to the spec. sheet @.
>
> http://www.garmin.com/manuals/spec35.pdf\

That's not correct. The current consumed is just a little
higher on the high voltage GPS35 running at **6 volts*, its
lowest operating voltage (compared to the low voltage GPS35).

> Maybe one of the engineer math wizards could jump
> in and make a calculated power usage comparison
> report on the two.

It's a little like comparing apples and oranges, but I'll
email again the whole story later when I have more time.

Hank

Hi Hank,

I think Garmin has 'helped' with the confusion by using two different values for the current draw on the two units. My calculations show little difference in the two at the 6 volt level but I don't trust my calculations. When you have a moment, please make the comparison for us so everyone can better understand the two.

Stephanie

Ok, compare them at 6 volts to make them apples and apples.
That is what i was thinking,but not conveyed in my mail.

It seemed like a significant difference when i did a
quick guestimate.

Show me the figures when you get time Hank.

3054. Re: [tvnsp] Garmin GPS35 HVS for $80

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-11 17:43:33 UTC
From: randy farley
Topic: 3048 Message: 3054

Stephanie

I,m not skeptical about the units quality. I am just
looking for the lowest current draw for ballooning
purposes.

I did notice the current units in the spec. sheet were
different between the HVS and LVS.
So far i have not had time to do the proper mathwork.
I figured by throwing out my comment "math wizards",
someone would come up with the proper comparison facts.
When someone "shows me the math" i can make a smarter
decision ;-)

Really appreciate the legwork you are doing to procure
these units. You need a job as a purchasing agent ;-)

>I think Garmin has 'helped' with the confusion by using two different
>values for the current draw on the two units.

What Garmin did was to give a current draw (in milliamperes)
for the 3.6-6 unit, and a *power* draw (in milliwatts) for
the 6-42 "high voltage" unit. The good reason for doing this
is that the current drain is constant for the former, but not
for the latter.

This is due to the characteristics of switching regulators,
one of which is in the 6-42 but not the 3.6-6.

>My calculations show little difference in the two at the 6 volt level but I
>don't trust my calculations.

Stephanie, your arithmetic is correct. Using typical values,
the low voltage unit draws 120 milliamps; the high voltage
at 6 volts draws 145 milliamperes and that steadily decreases
with increasing supply current thanks to the switching regulator.
At car voltage it will be down to about 65 milliamps.

To me, the high voltage unit is a very good all around unit
and the one I'd go for, even if I did plan on flying it once
in a while.

If it was exclusively for balloon use and *nothing* else, then
the low voltage one would have a slight edge.

I've attached a graph that shows how the current works for
both types of Garmins.

That should have read "with increasing supply *voltage*"

Thanks, I know the group will appreciate these figures and they agree with mine. Garmin lists the LVS as using 120-140 mA which makes the two units a draw at 6 volts. In MHO the HVS would actually be more efficient as long as you could feed it more than 6 volts but the LVS is the only choice if your source is 6 volts maximum.

Hank

Pictures speak louder than words to me sometimes ;-)
Thanks for the interpretation and reasoning for the values
from garmin.

The HV model is the best all around unit then. I'm glad to
see this.

The LV model must have been made so you can run it off a
laptop and use the 5v from a serial port ?

Are switching regulators affected by low temperatures to
any significant degree?

Stephanie, I'll take two now.

I think maybe Garmin's main idea was to make one model that runs from the lowest possible voltage.

> Are switching regulators affected by low temperatures to
> any significant degree?

Not as far as I know. ANSR and possibly Project Traveller use switching regulators in their onboard computers.

I'm happy to have possibly been able to shed a little light on the Garmin specs since they seemed to have some bearing on folk's choices about the units Stephanie found.

Hank

3063. Garmin GPS35 LVS and GPS35 HVS Units

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-12 23:45:40 UTC
From: Stephanie Steele
Topic: 3063 Message: 3063

Hi everyone,

I have firm quotes now from the sellers of these two units. There are 8 LVS units available and 32 HVS units. The LVS units are OEM (which means the cabling is bare, you add your own serial connector & power connector). Price is $106 each plus shipping to you for the LVS and $80 plus shipping to me and to you on the HVS (probably around $90 plus or minus a few bucks). For those out of the Treasure Valley who inquired I will ship to you in one box for your distribution to your groups. I need to know from everyone how many of each model you want. I'll send you back your total and will need payment right away as I obviously can not front this much money myself.

Hope this helps everyone out in your search for these units.
